Super Solution

Low voltage circuit breakers

LS *IS*

LSIS continues
the value and the prominence of LG

**New Name for LG Industrial Systems,
New Take-off for LSIS**

To advance to the next level,
LG Industrial Systems is reborn as LS Industrial Systems.

LSIS will continue to lead the future
of industrial electrics and automation by providing

Total Solution, a core essential
for competition in the 21st century industrial era.

Research & Development

We provide differentiated values.

The world-class Power Testing & Technology Institute guarantees certified products and global brands.

The PT&TI is an accredited testing laboratory that provides a worldwide testing service with a 1500MVA-capacity High Power Laboratory, a High Voltage Laboratory, and a Reliability Testing Laboratory. Its testing has been fully acknowledged and recognized by overseas testing certification bodies, such as KEMA of Netherlands, UL of America, and CE of the EU for its low voltage testing.

Global technology and R&D are behind the best industrial Electric power and automation products from LSIS

Quality Test at PT&T

High Voltage Test / Impulse Test

Characteristics Test / VCB Characteristics Test

Short-Circuit Test / ACB Breaker Test

Environmental Test /
Non-stop High Temperature Test

Electro Technology R&D Center

The Electro Technology R&D Center focuses on overall research and development activities related to power supply systems such as low and high voltage equipment as well as integrated digital networks, automatic switchboards and integrated power protection.

The R&D Center maximizes energy efficiencies by integrating rapidly developing information & technology, communication, electronics and mechanical engineering, while concentrating its efforts in creating a safe and pleasant industrial environment.

● Power Equipments

The R&D Center researches products and technologies related to low and high voltage circuit breakers and contactors as well as power transmission & distribution.

● Electric Technology

The R&D Center analyzes and researches core technologies related to power equipment.

● SCADA

The R&D Center carries out projects and technology research in the fields of SCADA and DAS.

● Simulator

The R&D Center predicts probable electrocution hazards by conducting simulated analyses of power generation phenomena, and develops simulation technologies and products that can optimize the constituent facilities.

Power Testing & Technology Institute

PT&T is a KOLAS-qualified (Korea Laboratory Accreditation Scheme) accredited testing laboratory and provides worldwide testing service with its 1500MVA-capacity High Power Laboratory, High Voltage Laboratory and Reliability Testing Laboratory.

PT&T is also fully recognized by foreign testing and certification bodies of high reputation as CESI of Italy, KEMA of Netherlands, UL of America, etc. for its low voltage testings.

● Available Tests

- Electro-Mechanical Tests
- Insulation Performance Tests
- Short-Circuit Tests
- Reliability Evaluation Tests
- Arc Tests
- Environmental Tests

● Research & Development

Testing Technology, Measuring & Analyzing Technology, Power Equipment Monitoring & Diagnostic Techniques, Reliability Testing & Evaluation Technology.

Solution provider

You can count on us.

**New Face & New Resolution To become
a global leader that gives top priority to customer values**

We promise you that LSIS will be reborn as a corporation that returns the best values to its customers.

We are committed to global product development, driving future growth, and expanding the overseas market share, as well as consolidating existing business.

Join us in a future where LSIS will become a genuine global leader.

Customer satisfaction with world-class products and services: LSIS is committed to excellence!

Electric Power Industry | Electric Equipment & Systems

The electric equipment and systems of LSIS, ranging from low to high voltage products, have not only acquired ISO 9001 and 14001 certification for their efficient design and excellent quality, but many other certificates, including KEMA, TÜV, CESI, ASTA, and KERI. The outstanding quality of the products that we are manufacturing conforms to international standards such as IEC, UL, ANSI, CCC, JIS, and KS.

We also provide Total Solutions that encompass customized designs and more advanced technology, as well as efficient production and installation, and highly accurate testing and analysis of power equipment.

Automation Industry | Automation Equipment, Industrial IT & RFID

LSIS, a leading pioneer of the domestic automation business, developed the first ever PLC, Inverter (AC Drive), and DCS in Korean automation history. We now provide Total Solutions through the diverse application of our own products, ranging from controllers to control systems that are based on sophisticated technology and proven experience, to bring innovative change to distribution systems and logistics.

■ Design for technical strong point: The Susol MCCB

SuSol Series MCCB is available for world best breaking capacity up to 150kA, and MS is seal structure for hidden electricity Arc.

SuSol product represents simultaneously simple and complicated design for using cut diamond motive to emphasize on the hardness of industrial product.

And we applied the identity of product image by designing same concept MCCB and MS which is installed to cubicle.

SuSol Series acquire the competitive power through getting the picking up GD product and winning IF Design Award.

Super Solution

For power distribution

- ▶ The highest breaking capacity
- ▶ Optimum coordination technique (Cascading & discrimination)
- ▶ Powerful engineering tools

For protection of motor & its control device

- ▶ Optimal overload protection
- ▶ Guaranteed type-2 coordination between circuit breaker and contactor, relay

For controlling and disconnecting circuits

For extensive applications

- ▶ Wide range of optimized auxiliaries and accessories

Global Leading Products

Susol

Super solution

- Super Performance
- Super Breaking capacity
- Super Optimum coordination
- Super Extensive applications

Susol TE, TD, TS series

Circuit breakers and Disconnecting switches

Susol circuit breakers provide superior performance in a compact package. They are used in cascade rated systems, allowing the use of lower interruption circuit breakers downstream, which lead to lower system cost. While meeting IEC60947-2 service and interrupting ratings, these breakers provide unmatched flexibility by

employing a wide variety of trip units including fixed thermal & magnetic, adjustable thermal-fixed magnetic, adjustable thermal adjustable magnetic, and electronic options.

Susol TE and TD circuit breaker is available in one frame size in ratings from 16 to 160 amperes and TS circuit breakers are available in three frame sizes in ratings

from 40 to 1600 amperes and in interrupting capacities up to 150 kA at 415VAC.

Standard calibration is at 40°C with optional 55°C factory calibration available for applications where higher ambient temperatures are encountered.

Susol MCCB Communication

■ Communication interface:RS485 (ModBUS)

■ Transmittable data :

- Reading of protection settings
- The highest current of the three phases
- Measurement: R, S, T and N phase current (RMS)
- Fault reading: Type of fault, Fault phase

■ The setting of communication address By using TR button and LCD display (Ammeter)

■ ZSI Enable/Occurrence

■ Power source: DC24V Power is required

Providing optimal solution

- MCCB(MODBUS) → CU → Profibus_DP → PLC → EtherNET → Supervision PC
- MCCB(MODBUS) → PLC → EtherNET → Supervision PC
- MCCB(MODBUS) → CU → RS485(DNP) → SUB_Supervision PC
- MCCB(MODBUS) → SUB_Supervision PC

Susol MCCB

Residual Current Devices

■ Protection against earth leakage currents

The Susol circuit breaker can offer protection against earth leakage currents by using an add-on residual current device (RCD). RCD unit interfaces directly below the circuit breaker trip unit area without the use of any secondary wiring or connections.

Residual Current Devices

Residual Current Devices

RTU23, RTU33 and RTU43 for TS type MCCBs

Apart from the protection against overloads typical of automatic circuit breakers, the residual current circuit breaker derived from them also guarantee protection of people against earth leakage currents, thereby ensuring protection against direct contacts, indirect contacts and fire hazards.-(ELCB)

The RCD unit has numerous current and time settings and an override blocking the time settings when set to 30mA. The earth leakage test button tests the electrical and mechanical operation of the device. In order to allow for a dielectric test of the breaker and RCD combination without damaging the electronics, the dielectric plug is placed within the setting area.

The RCD unit may be equipped with an alarm switch (FAL) to remotely indicate tripping due to an earth leakage current.

Molded Case Circuit Breakers

The new series of Susol circuit-breakers is available in four frame sizes : 160, 250, 630, 800, 1600AF

The breakers are able to cover a range of service currents up to 1600A and are available in the fixed version and plug-in version.

The breaking capacities, at 380/415V, are classified by following letters:

S: 37kA for 100 and 160AF

N: 50kA for 160, 250 and 1600AF

65kA for 630 and 800AF

H: 75kA for 1600AF

85kA for 160, 250 and 630AF

100kA for 800AF

L: 150kA for 160, 250, 630, 800 and 1600AF

Susol circuit-breakers are climate-proof. The breakers are intended for use in rooms where there are no excessive operating conditions (e.g. dust, corrosive vapors, gases).

If the circuit-breakers are used in dusty or humid locations, suitable enclosures should be provided. Sufficient fresh air supply must be provided if there are harmful gases (e.g. hydrogen-sulfide vapor) in the ambient air.

All Susol circuit breakers offer positive contact indication and are suitable for isolation in compliance with standards IEC 60947-1 and 2.

Susol circuit-breakers are suitable for protection of

- Power distribution systems supplied by transformers or generators
- Motor and generator

A switch-disconnector of Susol circuit breakers is available for circuit control and isolation.

Standards & Approval

Susol

Susol series circuit breakers and auxiliaries comply with the following international standard:

IEC 60947-1

Low-voltage switchgear and controlgear
- Part 1: General rules

IEC 60947-2

Low-voltage switchgear and controlgear
- Part 2: Circuit-breakers

IEC 60947-3

Low-voltage switchgear and controlgear
- Part 3: Switches, disconnectors, switchdisconnectors and fuse-combination units

IEC 60947-4

Low-voltage switchgear and controlgear
- Part 4-1: Contactors and motor-starters
Electromechanical contactors and motor starters
Switches, disconnectors, switchdisconnectors
- Part 4-2: Contactors and motor-starters
AC semiconductor motor controllers and starters
- Part 4-3: Contactors and motor-starters
AC semiconductor controllers and contactors for non-motor loads

The following certificates are available on a request.

- CE Declaration of conformity
- Certificate of conformance test (CB) - IEC 60947
- Full type test report issued by KEMA
- Certificate of conformance test - CCC (China)
- Letter of origin

CE conformity marking

The CE conformity marking shall indicate conformity to all the obligations imposed on the manufacturer, as regards his products, by virtue of the European Community directives providing for the affixing of the CE marking.

When the CE marking is affixed on a product, it represents a declaration of the manufacturer or of his authorized representative that the product in question conforms to all the applicable provisions including the conformity assessment procedures. This prevents the Member States from limiting the marketing and putting into service of products bearing the CE marking, unless this measure is justified by the proved non-conformity of the product.

IECEE CB SCHEME

The IECEE CB Scheme is the world's first truly international system for acceptance of test reports dealing with the safety of electrical and electronic products. It is a multilateral agreement among participating countries and certification organizations. A manufacturer utilizing a CB test report issued by one of these organizations can obtain national certification in all other member countries of the CB Scheme.

The Scheme is based on the use of international (IEC) Standards. If some members' national standards are not yet completely harmonized with IEC Standards, national differences are permitted if clearly declared to all other members. The CB Scheme utilizes CB Test Certificates to attest that product samples have successfully passed the appropriate tests and are in compliance with the requirements of the relevant IEC Standard and with the declared national differences of various member countries.

The main objective of the Scheme, is to facilitate trade by promoting harmonization of the national standards with international Standards and cooperation among product certifiers worldwide in order to bring product manufacturers a step closer to the ideal concept of "one product, one test, one mark, where applicable".

Structure

Susol

The primary components are: a switching mechanism, an automatic tripping device (and manual trip button), contacts, an arc-extinguishing device, terminals and a molded case.

Mechanism unit

- Unvarying contact force regardless of over travel
- RTA (Rapid Toggle Area)
Open speed of moving contact is rapid by **optimized cam curve** regardless of trip signal

Optimized cam curve

Unvarying contact force

Structure

Susol

Molded case

- UL94 V-0 flame retarded
- High strength

Trip button (push to trip)

- Enables tripping mechanically from outside, for confirming the operation of the accessory switches and the manual resetting function.

Arc-Extinguishing unit

- PASQ Type Quenching Chamber
- Very superior to increasing arc voltage during short time
- PASQ ;
 - Puffer Assisted Self-Quenching
 - Patented by LSIS

Handle

- Function of indications
 - "ON"
 - "OFF"
 - "TRIP"
- Resetting
 - When the handle indicates "tripped" position it must first be reset by moving the handle to the "OFF" position and then closing is possible
- Trip-Free even if the handle is held at "ON", the breaker will trip if an over current flows
- Suitable for Verification of the main contact position under abnormal conditions because the handle doesn't indicate open position

Overview of trip units

Susol

On Susol circuit breakers, the thermal-magnetic and electronic trip units are interchangeable and may be rapidly fitted to the circuit breakers.

It is therefore easy to change the protection of a given circuit following a modification in an installation. On TS400 and 630 circuit breakers, the electronic trip units are interchangeable plug-in modules. Trip unit ETM offers a large number of protection settings.

Each Trip devices has different types of protection depending on the associated trip unit:

- Standard protection
- Protection of networks supplied by line distribution
- Protection of long cables
- Protection of DC networks
- Protection of motor-starters
- Service connection circuit breaker (for special subscriber contracts)

Susol TD100, TD160 circuit breakers may be equipped with either FTU or FMU.

The trip units are not interchangeable types and can be supplied only after fixed with circuit breakers.

Double contactor structure

Optimize

Repulsion force

Shape of contactor

- Induce easily the arc mobility to grid direction
- Rapidly redeploy the arc from moving contactor
- Prevent contact tip from erosion

Open speed & contact force

Fig. 3 "ON" position

Fig. 4 "OFF" position

Fig. 5 "TRIP" position

ON position

- Unvarying contact force regardless of over travel
- Open speed of moving contact is rapid by optimized cam curve regardless of trip signal
- Function of trip free

OFF position

- Push to trip in OFF position
 - * Reset pin moment < Main spring moment
- Stability of endurance

TRIP position

- Enables tripping mechanically from outside, for confirming the operation of the accessory switches and the manual resetting function

Degree of protection

Susol

The table indicates the degrees of protection guaranteed by Susol circuit-breakers according to several type of installation. Basically, the fixed parts are always preset with IP20 degree of protection.

IP65 degree of protection can be obtained with the circuit-breaker installed in a switchboard fitted with an extended rotary handle operating mechanism transmitted on the compartment door.

Type	Degree of protection	IP	Protection of persons against access to hazardous parts with:
 Circuit breaker	Full penetration of 12.5mm diameter sphere not allowed. The jointed test finger shall have adequate clearance from hazardous parts	IP20	Wire
 Circuit breaker with terminal cover	The access probe of 2.5mm diameter shall not penetrate.	IP30	Wire
 Plug-in circuit breaker	Full penetration of 12.5mm diameter sphere not allowed. The jointed test finger shall have adequate clearance from hazardous parts. <small>* When the circuit breaker is installed and the supplied covers are mounted.</small>	IP20 or IP30	Wire
 Circuit breaker with cover frame for door cutout	The access probe of 1.0mm shall not penetrate.	IP40	Wire
 Circuit breaker with cover frame and motor operator	The access probe of 1.0mm diameter shall not penetrate.	IP40	Wire
 Circuit breaker with cover frame and rotary direct handle	The access probe of 1.0mm diameter shall not penetrate.	IP40	Wire
 Circuit breaker with cover frame and rotary extended handle	Totally protected against ingress of dust and water jets from any direction	IP65	Wire

The trip unit ATU is available from 125A

MCCBs for power distribution

Susol

Thermal magnetic trip units Overview

Susol series circuit breakers can be installed with thermal magnetic trip units. And, there are two kinds of trip units according to way of installation as follows.

- Built-in trip units for TE and TD series upto 160A
- Interchangeable trip units for TS series upto 800A

Function

Protection of power distribution

- Overload protection: Thermal protection with a fixed or adjustable threshold
- Short-circuit protection: Magnetic protection with a fixed or adjustable pick-up
- Protection of the fourth pole
4P3T type (neutral unprotected)
4P4T type 50% (neutral protection at $0.5 \times In$)
4P4T type 100% (neutral protection at $1 \times In$)

Operation

Thermal magnetic types

- Time-Delay operation
An overcurrent heats and warps the bimetal to actuate the trip bar by the bimetal characteristic.
- Instantaneous operation
If the overcurrent is excessive, the armature is attracted and the trip bar actuated by electromagnetic force.

Overview of electronic trip units (Standard type)

Types: ETS23, ETS33, ETS43

3 frame size of circuit breaker: 250AF, 630AF, 800AF

Only three(3) pole circuit breakers are available.

The Trip units can be mounted on circuit breakers of N, H and L type from TS100 to TS800.

Test connector for trip unit (AC/DC 30mA ~ AC/DC 100mA)

Protection

- Overload protection
- Short-circuit protection

MCCBs for power distribution

Susol

Electronic trip units (Multifunction) ETM33 for TS400, TS630

Configuration

- | | |
|---|---|
| ① Adjustable rated current setting (Ir) | ⑧ Indication LED |
| ② Adjustable long time setting (tr) | ⑨ TR (trip reason) button |
| ③ Adjustable short time current setting (Ird) | ⑩ Display LCD (Ammeter) |
| ④ Adjustable time delay setting (tsd) | ⑪ Battery |
| ⑤ Adjustable instantaneous current setting (II) | ⑫ Test connector |
| ⑥ Adjustable earth fault current setting (Ig) | ⑬ Alarm LED 90% Ir : ON,
105% Ir or more: ON-OFF |
| ⑦ Adjustable earth fault delay setting (tg) | |

Alarm indication

The LED lights and remains lit when the load exceeds 90 % of Ir.

The LED blinks for an overload($\geq 105\%$ Ir), warning that the circuit breaker may trip.

Fault indications

LEDs indicate the type of fault that caused tripping:

Ir : overload

Ird : short-circuit (short time, instantaneous)

Ig : earth fault

If push the TR button to indicate the tripping reason, the indication LED of tripping is ON.

The information is however stored in memory and the LED can be reilluminated by pressing the TR button.

The LED automatically goes off and the memory is cleared when the circuit breaker is reset.

In normal condition, if push TR button, all indication LED is ON for testing auxiliary power and LED.

Setting example : In

400A

Io 0.5 0.6 0.7 0.8 0.9 1

Ir 0.8 0.85 0.9 0.95 1

$$Ir = 400 \times 0.8 \times 0.9 = 288A$$

MCCBs for power distribution

Susol

Electronic trip units (Multifunction) ETM33 for TS400, TS630

Short circuit protection

The short circuit threshold, I_{sd} is a multiple of the overload setting, I_r .

Setting example :

The breaker trips when the current exceeds 2880 A.

Short circuit time delay

Earth fault protection(E), optional

The ETM trip units measure the vectorial sum of the three phase current and, if present, that of the neutral conductor.

If the sum of these values exceeds the set current thresholds for a period of time greater than the time delay, the breaker is tripped.

Ig = insulation fault threshold
tg = earth fault time delay

MCCBs for power distribution

Susol

Electronic trip units (Multifunction) ETM33 for TS400, TS630

Ammeter (A), optional

The Ammeter device has an accuracy of $\pm 10\%$.
The highest phase current is displayed in upper line.
In under line, R, S and T phase current is scrolled autom.

Ammeter display limits:

- minimum current $\geq 0.3 \times In$ (one phase)
- maximum current $\leq 10 \times In$

Zone selective interlocking (ZSI), optional

Zone Selective Interlocking is mainly used in systems with high rated current and short circuit current values, with safety and service continuity requirements.
This type of discrimination can be achieved with circuit breakers equipped with specially designed electronic trip units (ETM for TS circuit breakers).

Zone selective interlocking (ZSI) is a system designed

- to reduce the stress on electrical distribution components during short-circuit or earth fault conditions.
- to reduce the tripping times (Lower than hundred milliseconds).
- to reduce the damage caused by the fault and of interferences to the power supply system;

A number of circuit breakers are interconnected one after another by a pilot-wire.

Power source: DC24V Power is required.

Operation

- With ZSI, ETM trip unit detects the fault and then send the signal to upstream circuit breaker which applies the set time delay and ignore its present short-time and or/ earth fault delay and clear the fault with no intentional delay.
- Without ZSI, ETM trip unit detects the fault and then trips the circuit breaker with intentional delay

MCCBs for power distribution

Susol

Electronic trip units (Multifunction) ETM33 for TS400, TS630

Communication(C), optional

Communication interface: RS485 (Modbus-RTU)

The Modbus RS485 system is an open bus on which communicating Modbus devices are installed. All kinds of PLCs and computers can be connected to the bus.

Transmitted data :

- Protection setting values
- Highest current of the three phases
- Measurement: R, S, T and N phase current
- Fault reading: Type of fault (Overload, short-circuit, etc)

The setting of communication address using TR button and LCD display (Ammeter).

Power source: DC24V Power is required.

Electronic trip units (Multifunction) ETM43 for TS800

Configuration

- | | |
|---|---|
| ① Adjustable rated current setting (Ir) | ⑩ Display LCD (Ammeter) |
| ② Adjustable long time setting (tr) | ⑪ Battery |
| ③ Adjustable short time current setting (Isd) | ⑫ Test connector |
| ④ Adjustable time delay setting (tsd) | ⑬ Alarm LED 90% Ir : ON,
105% Ir or more: ON-OFF |
| ⑤ Adjustable instantaneous current setting (Ii) | |
| ⑥ Adjustable earth fault current setting (Ig) | |
| ⑦ Adjustable earth fault delay setting (tg) | |
| ⑧ Indication LED | |
| ⑨ TR (trip reason) button | |

Alarm indication

The LED lights and remains lit when the load exceeds 90 % of Ir.
The LED blinks for an overload($\geq 105\% Ir$), warning that the circuit breaker may trip.

Fault indications

LEDs indicate the type of fault that caused tripping:

Ir : overload

Isd : short-circuit (short time, instantaneous)

Ig : earth fault

The information is however stored in memory and the LED can be reilluminated by pressing the TR button.

The LED automatically goes off and the memory is cleared when the circuit breaker is reset.

In normal condition, if push TR button, all indication LED is ON for testing auxiliary power and LED.

MCCBs for power distribution

Susol

Electronic trip units (Multifunction) ETM43 for TS800

Short circuit protection

The short circuit threshold, I_{sd} is a multiple of the overload setting, I_r .

Setting example :

The breaker trips when the current exceeds 2880 A.

Short circuit time delay

Earth fault protection(E), optional

The ETM trip units measure the vectorial sum of the three phase current and, if present, that of the neutral conductor.

If the sum of these values exceeds the set current thresholds for a period of time greater than the time delay, the breaker is tripped.

I_g = insulation fault threshold
 tg = earth fault time delay

MCCBs for power distribution

Susol

Electronic trip units (Multifunction) ETM43 for TS800

Ammeter (A), optional

The Ammeter device has an accuracy of $\pm 10\%$.
The highest phase current is displayed in upper line.
In under line, R, S and T phase current is scrolled autom.

Ammeter display limits:

- minimum current $\geq 0.3 \times In$ (one phase)
- maximum current $\leq 10 \times In$

Zone selective interlocking (ZSI), optional

Zone Selective Interlocking is mainly used in systems with high rated current and short circuit current values, with safety and service continuity requirements.
This type of discrimination can be achieved with circuit breakers equipped with specially designed electronic trip units (ETM for TS circuit breakers).

Zone selective interlocking (ZSI) is a system designed

- to reduce the stress on electrical distribution components during short-circuit or earth fault conditions.
- to reduce the tripping times (Lower than hundred milliseconds).
- to reduce the damage caused by the fault and of interferences to the power supply system;

A number of circuit breakers are interconnected one after another by a pilot-wire.

Power source: DC24V Power is required.

Operation

- With ZSI, ETM trip unit detects the fault and then send the signal to upstream circuit breaker which applies the set time delay and ignore its present short-time and or/ earth fault delay and clear the fault with no intentional delay.
- Without ZSI, ETM trip unit detects the fault and then trips the circuit breaker with intentional delay

MCCBs for power distribution

Susol

Electronic trip units (Multifunction) ETM43 for TS800

Communication(C), optional

Communication interface: RS485 (Modbus-RTU)

The Modbus RS485 system is an open bus on which communicating Modbus devices are installed. All kinds of PLCs and computers can be connected to the bus.

Transmitted data:

- Protection setting values
- Highest current of the three phases
- Measurement: R, S, T and N phase current
- Fault reading: Type of fault (Overload, short-circuit, etc)

The setting of communication address using TR button and LCD display (Ammeter).

Power source: DC24V Power is required.

Magnetic only trip unit MTU for TS100, TS160, TS250, TS400, TS630, TS800

Magnetic only release

For the protection of motors from 1.6 to 250kW(400V), TS100 to TS800 circuit Breakers must be equipped with a special trip unit MTU adjustable thresholds.

This assembly ensures: Short-circuit protection (magnetic trip unit with adjustable thresholds); Suitability for isolation. For the TS100 to TS800 circuit breakers, trip unit MTU is interchangeable.

The circuit breakers presented here: Provide protection against short-circuits; Are suitable for isolation as defined by IEC60947-2 standard.

The switch-disconnectors are different from the circuit-breakers in the absence of the conventional protection unit. They keep the overall dimensions, connection systems and accessories unchanged from the corresponding circuit-breakers. Installation standards require upstream protection. However, thanks to their high-set magnetic release, TD160 ... TS800 DSU are self protected.

Susol MCCB PV up to 800A

Warnings when using Susol MCCB on PV system

The following warning must be kept when using Susol MCCB on PV system
If not, it can result damages on any related products or injuries.

Warning

1. Please, follow the wiring as shown below.

When wired differently, usable voltage can be limited.

2. Use minimum of 60cm wire when wiring. Short wires can result increasing temperature.

3. When designing circuit by using busbar as picture on right, de-rated use is recommended.

It can cause temperature increase, wrongly trip, damage or fire due to shortage of heat release(Refer to De-rating table)

4. Please, maintain given thickness and length of busbar on the specification drawing.

Additional de-rating is required in order to release the heat when busbar specification is different than instructed.

5. It is recommended to use tin or silver plated busbar.

6. Install sun screens or fans to maintain KS or IEC standard 40 °C inside of connection and low voltage panels.

When inside temperature of panel exceeds 40 °C, it can cause temperature increase, wrongly trip, damage or fire.

Additional de-rating is required when panel temperature exceeds 40 °C.

7. Please, ask any other further questions before applying.

Derating Table for AF

The following tables are based on the following assumptions;

- Maximum permissible temperature of busbars are 100
- T : Temperature around the circuit breaker and its connections

Note) 1. The values presented in the tables are the result of trials and theoretical calculations on the basis of the assumption mentioned above.
2. These tables are intended as an aid in designing connection, however, the actual values must be confirmed by tests on the installation.

Susol

Operation characteristic

Long-time delay (L)

The function for overload protection which has time delayed characteristic in inverse ratio to fault current.

1. Standard current setting knob: Ir

- 1) Setting range in P type and S type: $(0.4-0.5-0.6-0.7-0.8-0.9-1.0) \times In$
- 2) Setting range in N type and A type: $(0.4 \sim 1.0) \times In$
 - I_u: $(0.5-0.6-0.7-0.8-0.9-1.0) \times In$
 - I_r: $(0.8-0.83-0.85-0.88-0.9-0.93-0.95-0.98-1.0) \times Iu$

2. Time delay setting knob: tr

- Standard operating time is based on the time of $6 \times Ir$
- Setting range: 0.5-1-2-4-8-16-20-Off sec (9 modes)

3. Relay pick-up current

- When current over $(1.15) \times Ir$ flows in, relay is picked up.
- 4. Relay operates basing on the largest load current among R/S/T/N phase.

Short-time delay (S)

The function for fault current (over current) protection which has definite time characteristic and time delayed in inverse ratio to fault current.

1. Standard current setting knob: Isd

- Setting range: $(1.5-2-3-4-5-6-8-10-Off) \times Ir$

2. Time delay setting knob: tsd

- Standard operating time is based on the time of $10 \times Ir$.
- Inverse time (I^2t On): 0.1-0.2-0.3-0.4 sec
- Definite time (I^2t Off): 0.05-0.1-0.2-0.3-0.4 sec

3. Relay operates basing on the largest load current among R/S/T/N phase.

4. When ZSI function was set, the protection operation will take place instantaneously with input absence by downstream devices. It is advised to disable its ZSI function on the last downstream device.

Instantaneous (I)

The function for breaking fault current above the setting value within the shortest time to protect the circuit from short-circuit.

1. Standard current setting knob: II

- Setting range: $(2-3-4-6-8-10-12-15-Off) \times In$

2. Relay operates basing on the largest load current among R/S/T/N phase.

3. Total breaking time is below 50 (± 10)ms.

MCCBs for power distribution up to 1600A

Susol

Ground Fault (G)

The function for breaking ground fault current above setting value after time-delay to protect the circuit from ground fault.

1. Standard setting current knob: Ig
 - Setting range: $(0.2-0.3-0.4-0.5-0.6-0.7-0.8-1.0-\text{Off}) \times I_n$
2. Time delay setting knob: tg
 - Inverse time ($I^2 t$ On): 0.1-0.2-0.3-0.4 sec
 - Definite time ($I^2 t$ Off): 0.05-0.1-0.2-0.3-0.4 sec
3. Ground fault current is vector sum of each phase current. Therefore, 3Pole products may operate under its phase-unbalance including ground fault situations.(R+S+T+(N) Phase)
4. When ZSI function was set, the protection operation will take place instantaneously with input absence by downstream devices. It is advised to disable its ZSI function on the last downstream device.
5. Ground-fault functions are basically provided with products equipped with a trip relay through its internal CT that is embedded in each phase.(But, it can't be used with earth-leakage protection function at the same time)

Earth Leakage (G) - Option

The function for breaking earth leakage current above setting value after time delay to protect the circuit from earth leakage. (A, P, S type)

1. Standard setting current knob: $I_{\Delta n}$
 - Setting range: 0.5-1-2-3-4-5-10-20-30-Off (A)
2. Time delay setting knob: Δt
 - Trip time: 140-230-350-800 ms
 - Alarm time: 140-230-350-800-950 ms
3. Settings within its alarm range will prevent its breaker from tripping but activating its alarm.
4. This function is enabled and can be used only with standard ZCT provided by LS or private external CT(second output 5A) selected by customers.
5. When ZSI function was set, the protection operation will take place instantaneously with input absence by downstream devices. It is advised to disable its ZSI function on the last downstream device.

* Use cautions with earth-leakage current settings

- When using a standard ZCT provided by LS, the setting range is from 0.5 to 30A which is based on its primary current. But MCCB installed like A type (displayed on the left side) should only be cable-connected and its rated current should be less than 1600A.
- When using other CT selected by customers, the setting range is from 0.5 to 5A based on its secondary current.(Secondary output rating : 5A)
Hence, under 100:5A CT, if trip relay is set to 0.5A, earth-leakage exceeding 10A will activate its operation ($0.5A \times 20 = 10A$)

* Guideline for the external CT usage

- Earth-leakage protection characteristics using the standard CT which is installed inside of MCCB can protect currents from 20 to 100% range on its rated current.
- As rated currents on MCCB increases, current that is covered by its standard CT increase as well. This can not protect against small leakage currents.
ex) 400A MCCB Min. Earth-leakage current $400A \times 20\% = 80A$
 $4000A$ MCCB Min. Earth-leakage current $4000A \times 20\% = 800A$
- Therefore, customers are advised to install an external CT in accordance with its rated currents within its systems. And choose trip relay(E, X type) which is required with external CT usage in order to provide earth-leakage functions.

Voltage module

For P and S type Trip relay, separate voltage module is necessary to measure other element besides current (Separate purchase is needed)

- Voltage input range: AC 60~690V

MCCBs for power distribution up to 1600A

Susol

ZSI - Zone Selective Interlocking (A, P, S type)

Zone-selective interlocking drops delay time that eliminates faults for breakers. It minimizes the shock that all kinds of electric machineries get under fault conditions.

1. In case of that short time-delay or ground fault accident occurs at ZSI built in system, the breaker at accident site sends ZSI signal to halt upstream breaker's operation.
2. To eliminate a breakdown, trip relay of MCCB at accident site activates trip operation without time delay.
3. The upstream breaker that received ZSI signal adhere to pre-set short time-delay or ground fault time-delay for protective coordination in the system.
However upstream breaker that did not receive its signal will trip instantaneously.
4. For ordinary ZSI operation, it should arrange operation time accordingly so that downstream circuit breakers will react before upstream ones under overcurrent/short time delay/ ground fault situations.
5. ZSI connecting line needs to be Max. 3m.

- 1) Occurrence of fault A
 - Only breaker ① performs instantaneous trip operation.
- 2) Occurrence of fault B
 - Breaker ② performs instantaneous trip operation,
breaker ① performs trip operation after prearranged delay time
 - But if breaker ② did not break the fault normally,
breaker ① performs instantaneous trip operation to protect system.

Remote reset and digital I/O (A, P, S type)

In case of that MCCB operates due to accidents or over current, Trip relay indicates the information of the accident through the LED and LCD. Trip relay A, P and S type is possible to perform the remote reset by digital input, and have 3 DO(Digital output).

1. Methods to reset Trip relay is to push the Reset button on the frontal side and to use the remote reset.
 2. Digital input
 - [R11-R22] input: Remote reset
 - [Z1-Z2] Input: ZSI input
 - [E1-E2] Input: ZCT for earth leakage detection or external CT input
 - ※ All DI are dry contact that has 3.3V of recognition voltage. When inputting close by SSR(Solid State Relay) or open-collector, connect collector(Drain) to R11.
 3. Digital output 3a(524, 534, 544-513)
 - Fault output: Long/Short time delay, Instantaneous, Ground fault, UVR, OVR, UFR, OFR, rPower, Vunbal, lunal
(Maintains state as Latch form until user pushes reset.)
 - General DO: when setting L/R as remote, it is available to control close/open remotely by using communication.

Withdrawal Wiring for Trip Relay

⚠ Caution

1. In case of disassembling and assembling the main cover, screw should be tightened in specific torque of 1.5N.m (15.3kgf.cm)
2. In case of disassembling and assembling the main cover by over tightening torque, the parts of MCCB can be damaged.

Auxiliary and Alarm switch

Auxiliary switch (AX)

Auxiliary switch is for applications requiring remote “ON” and “OFF” indication. Each switch contains two contacts having a common connection. One is open and the other closed when the circuit breaker is open, and viceversa.

Alarm switch (AL)

Alarm switches offer provisions for immediate audio or visual indication of a tripped breaker due to overload, short circuit, shunt trip, or undervoltage release conditions. They are particularly useful in automated plants where operators must be signaled about changes in the electrical distribution system. This switch features a closed contact when the circuit breaker is tripped automatically. In other words, this switch does not function when the breaker is operated manually. Its contact is open when the circuit breaker is reset.

Combination switch (AX+AL)

It consists of one auxiliary switch (AX) and one alarm switch (AL) in a body to connect into the same position of the breaker.

Contact

Shunt trip, SHT

The shunt trip opens the mechanism in response to an externally applied voltage signal. The releases include coil clearing contacts that automatically clear the signal circuit when the mechanism has tripped.

The shunt release can be installed in the right accessory compartment of the MCCBs.

- Range of operational voltage
AC: 0.7~1.1Vn, DC: 0.8~1.1Vn
- Frequency(Only AC): 45Hz ~ 65 Hz

Rating

Susol

Undervoltage release, UVT

The undervoltage release automatically opens a circuit breaker when voltage drops to a value ranging between 20% to 70% of the line voltage. The operation is instantaneous, and after tripping, the circuit breaker cannot be re-closed again until the voltage returns to 85% of line voltage. Continuously energized, the undervoltage release must be operating before the circuit breaker can be closed. The undervoltage release can be easily installed in the right accessory compartment of the MCCBs.

- Range of tripping voltage: 0.2 ~ 0.7Vn
- MCCB making is possible voltage: 0.85Vn (Exceed)
- Frequency (Only AC): 45Hz ~ 65Hz

Terminals

Front connection

Extended terminal

- As an optional part of circuit breaker
- Can increase the pitch of the terminals

MCCB Pole	Type	Feature
TE100/160	3P ET13E	
	4P ET14E	

Rear connection

Rear connection terminals are used to adapt Susol TE circuit breakers to switchboards or other application that require rear connection.

These can be connected directly to circuit breakers without any modification.

Flat terminals

MCCB Pole	Type	Feature
TE100/160	3P RTF13	
	4P RTF14	

Accessories for TE series

Susol

Insulation

Insulation by barrier

These allow the insulation characteristics between the phases at the connections to be increased. They are mounted from the front, even with the circuit-breaker already installed, inserting them into the corresponding slots.

They are incompatible with both the insulating terminal covers.

It is possible to mount the phase separating partitions between two circuit-breakers side by side.

Type	Applied MCCB	Set quantity
B13C	TE100, TE160	3P 4P 4pcs 6pcs

Short type covers

Insulation by terminal cover

Insulation terminal cover

The terminal covers are applied to the circuit-breaker to prevent accidental contact with live parts and thereby guarantee protection against direct contacts.

Two types by length are available:

Short type covers, ITS

- IP40 degree of protection
- For fixed circuit-breakers with rear terminals and for moving parts of plug-in

Long type covers, ITL

- IP40 degree of protection
- For fixed circuit-breakers with front, front extended, front for cables terminals.

Long type covers

Type Terminal		cover	
Frame type	pole	Long type	Short type
TE100, TE160	3P	ITL13E	ITS13E
	4P	ITL14E	ITS14E

Accessories for TE series

Interlock

Mechanical Interlock
(Padlocks are not supplied)

Operation

Left MCCB: ON/OFF is possible
Right MCCB: Off lock

Left MCCB: Off lock
Right MCCB: ON/OFF is possible

Both MCCBs are of locked

Mechanical interlocking device

The mechanical interlock (MIT) can be applied on the front of two breakers mounted side by side, in either the 3-pole or 4-pole version and prevents simultaneous closing of the two breakers.

Fixing is carried out directly on the cover of the breakers.

The front interlocking plate allows installation of a padlock in order to fix the position. (possibility of locking in the O-O position as well)

This mechanical interlocking device is very useful and simple for consisting of manual source-changeover system.

MCCB		Interlock
Frame type	pole	
TE100, TE160	3P MIT13E	
	4P MIT14E	

Note) Terminal covers do not use with the interlock.

Electrical auxiliaries

Auxiliary switch (AX), Alarm switch (AL) and Fault alarm switch (FAL)

Auxiliary switch (AX)

Auxiliary switch is for applications requiring remote "ON" and "OFF" indication.

Each switch contains two contacts having a common connection.

One is open and the other closed when the circuit breaker is open, and vice-versa.

AX

AL

Alarm switch (AL)

Alarm switches offer provisions for immediate audio or visual indication of a tripped breaker due to overload, short circuit, shunt trip, or undervoltage release conditions.

They are particularly useful in automated plants where operators must be signaled about changes in the electrical distribution system. This switch features a closed contact when the circuit breaker is tripped automatically. In other words, this switch does not function when the breaker is operated manually.

Its contact is open when the circuit breaker is reset.

Fault alarm switch (FAL)

FAL Indicates that the breaker has tripped due to overload or short circuit. And, it can be applied to only circuit breakers with electronic trip units.

Insulation

Short type covers

Long type covers

Insulation by terminal cover

Insulation terminal cover

The terminal covers are applied to the circuit-breaker to prevent accidental contact with live parts and thereby guarantee protection against direct contacts.

Two types by length are available:

Short type covers, ITS

- IP40 degree of protection
- For fixed circuit-breakers with rear terminals and for moving parts of plug-in

Long type covers, ITL

- IP40 degree of protection
- For fixed circuit-breakers with front, front extended, front for cables terminals.

Insulation

Insulation by barrier

These allow the insulation characteristics between the phases at the connections to be increased. They are mounted from the front, even with the circuit-breaker already installed, inserting them into the corresponding slots.

They are incompatible with both the insulating terminal covers.

It is possible to mount the phase separating partitions between two circuit-breakers side by side.

Interlock

Mechanical Interlock
(Padlocks are not supplied)

Mechanical interlocking device

The mechanical interlock (MIT) can be applied on the front of two breakers mounted side by side, in either the 3-pole or 4-pole version and prevents simultaneous closing of the two breakers.

Fixing is carried out directly on the cover of the breakers.

The front interlocking plate allows installation of a padlock in order to fix the position. (possibility of locking in the O-O position as well)

This mechanical interlocking device is very useful and simple for consisting of manual source-changeover system.

Operation

Left MCCB: ON/OFF is possible
Right MCCB: Off lock

Left MCCB: Off lock

Plug-in device

Plug-in device

The plug-in base is the fixed part of the plug-in version of the circuit-breaker. It will be installed directly on the back plate of panel.

The circuit-breaker is racked out by unscrewing the top and bottom fixing screws. Plug-in base makes it possible to extract and/or rapidly replace the circuit breaker without having to touch connections for ship and important installations.

Remote operation

Motor operator

Motor operators can also be operated by manual. The motor drives a mechanism which switches TD & TS toggle handle to the "ON" and "OFF/RESET" positions.

- The manual actuator handle is located on the front of the cover.
- Manual or Automatic operation can be selected.
- Applicable to 2, 3 and 4-pole breakers.

TS250 + MOP2

The motor operator is an essential device for constructing a remote operated automatic source-changeover system to ensure a continuous supply of electrical power at following certain installations:

- Commercial sector: Hospital, Tall building, Bank, Insurance companies, Shopping centers
- Industry: Ships, Assembly lines at plant, Military sites, Port and Railway installation

MCCB	Type	Control voltage	Actuation current (A)	Response time (ms)		Consumption (W)	Mechanical service life (operations)	No. of operations per hour
				Closing	Opening

Wiring connection

Standard connection

Circuit breaker On and Off controlled by remote operation and manual operation

Connection with alarm switch (AL)

- 1) The below connection diagram is the method of using a alarm switch (AL) without shunt or undervoltage trip.
- 2) After clearing the fault surely, manual reset is mandatory in case of tripping due to an electrical fault.

Connection with FAL (only for the breakers with electronic trip unit ETS or ETM)

- 1) The below connection diagram is the method of using a FAL for circuit breakers with electronic trip unit.
- 2) After clearing the fault surely, manual reset is mandatory in case of tripping due to an electrical fault.

Accessories for TD/TS series up to 800A

Susol

Remote operation

Manual operation

- 1) Insert the manual handle into the slot of Motor Operator surface and rotate it clockwise.
- 2) It must be rotated just 180° clockwise for safe operation of micro switch in the motor operator.
- 3) Return the manual handle after the manual operation
- 4) Turn the slide switch back to the position of AUTO.

CAUTION: When the circuit breaker is tripped by trip button in the OFF status,
it is impossible to operate motor operator automatically. It must be reset by manual operation.

Automatic operation

- 1) Set the slide switch to AUTO, then internal power is closed automatically.
- 2) Operating frequency should be less than these below regulated values.
TD 160N/H/L, TS250N/H/L: 180 operations per hour
- 3) Use the ON/OFF switch in the range of regulated values.
- 4) It may interfere near communication equipments because of internal switching power supply.
It's recommended that a noise filter be installed to power supply.
- 5) Please do not input ON/OFF signals at the same time during the automatic operation.
- 6) If the circuit breaker has a UVT attached inside, charge a UVT on the rated voltage before performing MOTOR OPERATOR.

Residual Current Devices (RCD)

The Susol circuit breaker can offer protection against earth leakage currents by using an add-on residual current device (RCD). In particular, the TS100, TS160 and TS250 circuit breakers can be combined with the RTU23 of residual current device, the TS400 and TS600 circuit breakers can be combined with the RTU33 of residual current device and the TS800 circuit breaker can be combined with the RTU43 of residual current device. In all cases the RCD unit interfaces directly below the circuit breaker trip unit area without the use of any secondary wiring or connections.

The Susol circuit breaker and an RCD unit combination can be connected like any stand-alone breaker and are available as fixed or plug-in devices. The main connection interface of the RCD is an exact replacement of the breaker connection area, thus allowing the use of all standard breaker terminals.

Overview

Apart from the protection against overloads typical of automatic circuit breakers, the residual current circuit breaker derived from them also guarantee protection of people against earth leakage currents, thereby ensuring protection against direct contacts, indirect contacts and fire hazards.-(ELCB)

The RCD unit has numerous current and time settings and an override blocking the time settings when set to 30mA. The earth leakage test button tests the electrical and mechanical operation of the device. In order to allow for a dielectric test of the breaker and RCD combination without damaging the electronics, the dielectric plug is placed within the setting area. The RCD unit may be equipped with an alarm switch (FAL) to remotely indicate tripping due to an earth leakage current.

Compliance with standards :

- IEC 60947-2 (industrial), Appendix B
- IEC 61009 (residential)
- IEC 60755, class A, immunity to DC components up to 6mA
- VDE664, operation down to -25°C

Remote indications :

RCD unit may be equipped with an alarm contact (FAL-fault alarm switch) to remotely indicate tripping due to an earth leakage current.

Power supply :

RCD unit are self-supplied internally by the distribution-system voltage and therefore do not require any external source. They continue to function even when supplied by only two phases.

Electrical auxiliaries

The following devices are installed into TS1000 to 1600AF circuit breakers regardless of frame size. And, the electrical auxiliaries can be easily installed in the accessory compartment of the circuit breakers which is cassette type.

AX

AL

Auxiliary switch (AX)

Auxiliary switch is for applications requiring remote “ON” and “OFF” indication. Each switch contains two contacts having a common connection. One is open and the other closed when the circuit breaker is open, and vice-versa.

Alarm switch (AL)

Alarm switches indicate that the circuit breaker has tripped due to overload, short circuit, shunt trip, or undervoltage release conditions. They are particularly useful in automated plants where operators must be signaled about changes in the electrical distribution system. This switch features a closed contact when the circuit breaker is tripped automatically. In other words, this switch does not function when the breaker is operated manually. Its contact is open when the circuit breaker is reset.

Electrical auxiliaries

SHT Shunt trip device

SHT is a control device which trips a circuit breaker from remote place, when applying voltage continuously or instantaneously over 200ms to coil terminals(C1, C2). When UVT coil is installed, its location is changed.

1. Rated voltage and characteristics of Trip coil

Rated voltage [Vn]		Operating voltage range [V]	Power consumption (VA or W)		Trip time [ms]
DC [V]	AC [V]		Inrush	Steady-state	
24~30 -		0.6~1.1 Vn	200	5	Less than 40ms
48~60 48		0.6~1.1 Vn			
100~130	100~130	0.56~1.1 Vn			
200~250 200~250		0.56~1.1 Vn			
-	380~480 0.56~1.1	Vn			

Note) Operating voltage range is the min. rated voltage standard for each rated voltage(Vn).

2. Specification of the wire

- Refer to the below table regarding the length and specification of wire when using trip coil with DC 24~30[V] or DC/AC 48~60[V] of rated voltage.

The maximum wire length

		Rated voltage [Vn]			
		DC 24~30 [V]		DC/AC 48 [V]	
Wire type		#14 AWG (2.08mm ²)	#16 AWG (1.31mm ²)	#14 AWG (2.08mm ²)	#16 AWG (1.31mm ²)
Operating voltage	100%	95.7m	61m	457.8m	287.7m
	85%	62.5m	38.4m	291.7m	183.2m

Accessories for TS series up to 1600A

Susol

Electrical auxiliaries

UVT Under Voltage Trip device

- If the voltage of the main or the control power is under voltage, UVT which is installed inside of the breaker breaks the circuit automatically. Please connect with UVT time-delay device in order to present the time delay function because UVT is technically instantaneous type.
- The closing of a circuit breaker is impossible mechanically or electrically if control power not supplied to UVT. To close the circuit breaker, 65~85% of rated voltage should be applied to both terminals of UVT coil (D1, D2).
- When using UVT coil, the double trip coil can not be used, and the location of trip coil is changed.

1. Rated voltage and characteristics of UVT coil

Rated voltage [Vn]		Operating voltage range [V]		Power consumption (VA or W)		Trip time [ms]
DC [V]	AC [V]	Pick up	Drop out	Inrush	Steady-state	
24~30 -		0.65~0.85 Vn	0.44~0.6 Vn	200	5	Less than 50ms
48~60 48						
100~130	100~130					
200~250 200~250						
-	380~480					

Note) Operating voltage range is the min. rated standard for each rated voltage (Vn).

2. Specification of the wire

- Refer to the below table regarding the length and specification of wire when using trip coil with DC 24~30[V] or DC/AC 48~60[V] of rated voltage.

The maximum wire length

Wire type		Rated voltage [Vn]			
		DC 24~30 [V]		DC/AC 48 [V]	
Operating voltage	100%	#14 AWG (2.08mm ²)	#16 AWG (1.31mm ²)	#14 AWG (2.08mm ²)	#16 AWG (1.31mm ²)
85%		48.5m	30.5m	233.2m	143.9m
		13.4m	8.8m	62.5m	39.3m

Note) In case of using UVT coil, the location of TC coil is changed.

UVT Time Delay Controller [UDC]

- UVT is a device which makes ACB tripped automatically to prevent the accident on load side due to under voltage or power breakdown.

There are two types, Instantaneous type and time delay type.

- It can be installed on the rail or to the cradle.
- Instantaneous type: only available with UVT coil.
- Time delay type: available by connecting UVT coil and UVT time delay controller.
- Common use for the all types.

1. The rated voltage and characteristic of UVT time delay controller

Rated voltage [Vn]	Operating voltage range [V]		Power consumption (VA or W)		Trip time[s]
DC [V]	AC [V]	Pick up	Drop out	Inrush	
48~60 48					
100~130 100~130		0.65~0.85 Vn	0.44~0.65Vn		
200~250 200~250				200	
-	380~480				5

Note) Operating voltage range is the min. rated standard for each rated voltage (Vh).

2. Wiring

* The wiring presented with red color should be set by users.

Accessories for TS series up to 1600A

Susuol

Rotary handle

The rotary handle operating mechanism is available in either the direct version or in the extended version on the compartment door.
It is always fitted with a compartment door lock and on a request it can be supplied with a key lock

Direct rotary handle

Degree of protection IP40
There are three types of direct rotary handle according to line load direction.
Indication of the three positions O(OFF), I(ON) and tripped. Circuit breaker locking capability in the OFF position by one to three padlocks, shackle diameter 5 to 6 mm (not supplied).

Door cut type for Direct rotary handle

Dimension of door cut

Note) 1. In case of disassembling and assembling the main cover, screw should be tightened in specific torque of 1.5N.m (15.3kgf.cm)
2. In case of disassembling and assembling the main cover by over tightening torque, the parts of MCCB can be damaged.

Accessories for TS series up to 1600A

Susol

Rotary handle

Locking system(Door lock)

The panel door can be locked at ON and TRIP position of rotary handle.
To open the panel door at ON position, just rotate release screw counterclockwise.
When MCCB is on position, panel door is can't be open.

⚠ Caution

- If the door is opened with much pressure when the position of handle is ON or TRIP, the handle lock lever will be damaged

Key lock

After locking handle, be sure that the key removed.

Key lock: locking OFF position

Locking by rotary handle with a key lock
A locking can be done by using the rotary handle which has key lock device.
The lock is used to lock the circuit-breaker in the OFF position.

Locking at ON or OFF position

Padlocking by rotary handle
A padlocking can be also done by using the rotary handle.
The lock is used to lock the circuit-breaker in the ON and OFF position.
Maximum three (3) padlocks with shackle diameters ranging from 5 to 6mm may be used. (Padlocks are not supplied)

Accessories for TS series up to 1600A

Susol

Rotary handle

Extended rotary handle

Degree of protections IP55

There are three types of extended rotary handle according to line & load direction. With Extended rotary handles, can be operate MCCB at the back of switchboards, from the switchboard front.

Indication of the three positions O(OFF), I(ON) and tripped circuit breaker locking capability in the OFF position by one to three padlocks, shackle diameter 5 to 6mm (not supplied). When MCCB is on position, panel door is can't be open.

- If the door is opened with much pressure when the position of handle is ON or TRIP, the handle lock lever will be damaged

Degree of protections

Type	Degree of protection	IP
 Circuit breaker with cover frame and rotary direct handle	The access probe of 1.0mm diameter shall not penetrate.	IP40
 Circuit breaker with cover frame and rotary extended handle	Totally protected against ingress of dust and water jets from any direction	IP65

Accessories for TS series up to 1600A

Susol

Locking devices

Removable padlock(PL)

This device allows the handle to be locked in the “OFF” position.
Locking in the OFF position guarantee isolation according to IEC 60947-2.

The locking device for the toggle handle can be installed in 3-pole and 4-pole circuit-breakers. Maximum three (3) padlocks with shackle diameters ranging from 5 to 8mm may be used. (Padlocks are not supplied)

Fixed padlock (PHL)

This device allows the handle to be locked in the “ON” and “OFF” position.
Locking in the OFF position guarantee isolation according to IEC 60947-2.

The locking device for the toggle handle can be installed in 3-pole and 4-pole circuitbreakers. Maximum three (3) padlocks with shackle diameters ranging from 5 to 8mm may be used. (Padlocks are not supplied)

Accessories for TS series up to 1600A

Susol

Locking devices

Mechanical interlock (MIT)

The mechanical interlock (MIT) can be applied on the front of two breakers mounted side by side, in either the 3-pole or 4-pole version and prevents simultaneous closing of the two breakers.

Fixing is carried out directly on the cover of the breakers.

The front interlocking plate allows installation of a padlock in order to fix the position. (possibility of locking in the O-O position as well)

This mechanical interlocking device is very useful and simple for consisting of manual source changeover system

Accessories for TS series up to 1600A

Susol

Terminal

Front connection of Fixed devices

Bars

Fixed, front-connection Susol TS1600AF devices are equipped with terminals comprising captive screws for direct connection of bars. Other connection possibilities for bars include vertical-connection adapters for edgewise bars and spreaders to increase the pole pitch to 95 mm.

Vertical busbar

Busbars

Bare cables

Lug terminals may be used to connect four 85 up to 240 mm^2 copper or aluminum cables for each phases. Bare cable connection is possible for rating up to and including 1250A

Lug terminal

L(mm) 25~55	
S(mm^2) Cu/Al	4 × 85 to 4 × 240
Torque(kgf · cm)	564

Accessories for TS series up to 1600A

Susol

Terminal

Crimped Terminals

Crimped terminals are combined with the vertical and extension busbars. One to four cables with crimped terminals ($\pm 300 \text{ mm}^2$) may be connected.

To ensure stability, connectors must be fixed and insulated between the terminal extensions.

Vertical busbar

Extension busbars

Accessories for TS series up to 1600A

Susol

Terminal

Rear connection of Fixed devices

(Orderable with a breaker)

Bars

Rear connection devices equipped with horizontal or vertical connectors may be directly connected to flat or edgewise busbars, depending on the position of the connectors.
Busbars are available to increase the pole pitch to 95mm

The standard type of rear connection type is horizontal type.

If customer want to conect busbars with vertical or comvination(horizontal and vertical) please order separately.

Busbars

Vertical busbar

Crimped Terminals

Crimped terminals enable connection of one to four cables with crimped terminals($\pm 300 \text{ mm}^2$)
To ensure stability, connectors must be fixed and insulated between the terminal extensions

Extension busbars

Accessories for TS series up to 1600A

Susol

Insulation

Terminal cover

Mounted on fixed, front-connection devices, it insulates power-connection points.

Barrier

These barriers are insulated between the phases for increase insulation level. It also can be easily mounted, even the circuit-breaker already installed, inserting them in the corresponding slots.

They are incompatible with both the insulating terminal covers.
It is possible to mount the phase separating partitions between two circuit-breakers side

Barrier for front connection

paking unit: 2ea/3Pole, 3EA/4Pole

Barrier for extension terminal

paking unit: 2ea/3Pole, 3EA/4Pole

Plate protection

paking unit: 1ea/3Pole, 1ea/4Pole

Safety clearance

When installing a circuit breaker, safety clearances must be kept between the breaker and panels, bars and other protection devices installed nearby. These safety clearances are depend on the ultimate breaking capacity and are defined by tests carried out in accordance with standard IEC 60947-2.

When a short circuit interruption occur, high temperatures pressures are present in and above the arc chambers of the circuit-breaker. In order to allow the pressure to be distributed and to prevent fire and arcing or short-circuit currents, safety clearances are required.

Connections for 1600AF

The quality of busbar connections depends, among other things, on the tightening torques used for nuts and bolts. Over-tightening may have the same consequences as under-tightening. The correct tightening torques for the connection of busbars to the circuit breaker terminals are indicated in the table below.

Examples of busbar connections

Susol TS1600 MCCB may be installed vertically, horizontally or flat on their back.

Front type

Front type with bars (on backplate or rail)

Front type with basbar (only on rail)

Rear type with bars (only on backplate)

Insulation distance

Examples

Tightening torques for busbar

Bolt	Drilling diameter (mm)	Tightening torque (kgf · cm)
M10	11	240~500

Insulation distance

Dimension(mm)

Utilisation voltage	X minimum
Ui≤600V	8mm
Ui≤1000V	14mm

Mounting & Connection

Susol

Size of busbar for 1600AF

The following tables are based on the following assumptions;

- Maximum permissible temperature of busbars are 100°C
- T : Temperature around the circuit breaker and its connections

Note) 1. The values presented in the tables are the result of trials and theoretical calculations on the basis of the assumption mentioned above.
 2. These tables are intended as an aid in designing connection, however, the actual values must be confirmed by tests on the installation.

Insulation barrier and plate protection on line side is standard.
 If customer want to using insulation accessories on load side, please oder separately.

Various short-circuit	A-7-64
Calculation example	A-7-65
Calculation graph	A-7-67

Technical information

Susol

Temperature derating

A derating of the rated operational current of the Susol TD and TS molded case circuit breaker is necessary if the ambient temperature is greater than 40°C. Namely, when the ambient temperature is greater than 40°C, overload-protection characteristics are slightly modified.

Electronic trip units are not affected by variations in temperature.

But, the maximum permissible current in the circuit breaker depends on the ambient temperature.

Derating chart

- Connection type: Standard
- Trip unit: FTU, FMU, ATU

MCCB	Rating (A)	Fixed MCCB (c/w Thermal-magnetic trip unit)

Derating table

The following tables are based on the following assumptions;
- T : Temperature around the circuit breaker and its connections

Note) 1. The values presented in the tables are the result of trials and theoretical calculations on the basis of the assumption mentioned above.
2. These tables are intended as an aid in designing connection, however, the actual values must be confirmed by tests on the installation.

TS1000 to TS1600 mounted

Using bar connection

- Cross section of bar: 1000 mm²

- Limit of temperature rising at terminal connection: 70k

Using the data below, it is possible to determine the maximum permissible currents when making the connections to busbars for a Vertical, TS1000/TS1600, taking into account the ambient temperature around the switchboard and the IP value. Connection to be made according to the busbar drawings supplied.

Permissible current at switchboard condition using above external terminal connections

Installation recommendation

Protection degree provided by enclosures (IP Code) IEC 60529

IP	<input type="checkbox"/>	<input type="checkbox"/>
		First characteristic numeral ×(numerals 0 to 6, or letter ×)
		Second characteristic numeral ×(numerals 0 to 8, or letter ×)
		Code letters (international Protection)

First characteristic numeral

	Degree of protection	
	Brief description	Definition
0 Non-protected		-
1	Protected against solid foreign objects of 50mm Ø and greater	The object probe sphere of 50mm Ø, shall not fully penetrate
2	Protected against solid foreign objects of 12.5mm Ø and greater	The object probe sphere of 12.5mm Ø, shall not fully penetrate
3	Protected against solid foreign objects of 2.5mm Ø and greater	The object probe sphere of 2.5mm Ø, shall not penetrate at all
4	Protected against solid foreign objects of 1.0mm Ø and greater	The object probe of 1.0mm Ø, shall not penetrate at all
5	Dust-protected	Ingress of dust is not totally prevented, but dust shall not penetrate in a quantity to interfere with satisfactory operation of the apparatus or to impair safety
6	Dust-tight	No ingress of dust

Second characteristic numeral

	Degree of protection	
	Brief description	Definition
0 Non-protected		-
1	Protected against vertically falling water drops	Vertically falling drops shall have no harmful effects
2	Protected against vertically falling water drops when enclosure tilted up to 15°	Vertically falling drops shall have no harmful effects when the enclosure is tilted at any angle up to 15° on either side of the vertical
3	Protected against spraying water	Water sprayed at an angle up to 60° on either side of the vertical shall have no harmful effects
4	Protected against spraying water	Water splashed against the enclosure from any direction shall have no harmful effects
5	Protected against spraying jets	Water projected in powerful jets against the enclosure from any direction shall have no harmful effects
6	Protected against powerful water jets	Water projected in powerful jets against the enclosure from any direction shall have no harmful effects
7	Protected against the effects of temporary immersion in water	Ingress of water in quantities causing harmful effects shall not be possible when the enclosure is temporarily immersed in water under standardized conditions of pressure and time
8	Protected against the effects of continuous immersion in water	Ingress of water in quantities causing harmful effects shall not be possible when the enclosure is continuously immersed in water under conditions which shall be agreed between manufacturer and user but which are more severe than for numeral 7

Application Primary use of transformer

Application for transformer protection

Transformer excitation surge current may possibly exceed 10 times rated current, with a danger of nuisance tripping of the MCCB. The excitation surge current will vary depending upon the supply phase angle at the time of switching, and also on the level of core residual magnetism.

So, it's recommended to select proper circuit breakers according to the continuous current carrying capacity of transformer. It requires to consider separately whether transformer is single phase or three phase. The below table indicates the proper molded case circuit breaker suitable for each transformer.

AC220V

Capacity of 3 phase transformer (kVA)	Below 1500	Below 1500	Below 2000	Below 3000

Application Primary use of transformer

Application for transformer protection (MCCBs for Transformer-Primary Use)

Transformers are used to change in the supply voltage, for both medium and low voltage supplies. The choice of the protection devices should be considered transient insertion phenomena, during which the current may reach values higher than the rated full load current; the phenomenon decays in a few seconds.

The peak value of the first half cycle may reach values of 15 to 25 times the effective rated current. For a protective device capable of protecting these units this must be taken into account. Manufacturers data and tests have indicated that a protective device feeding a transformer must be capable of carrying the following current values without tripping.

TD100/160, TS100~800 equipped with Thermal magnetic trip units

Application Protection of lighting & heating circuits

In the lighting & heating circuits, switching-surge magnitudes and times are normally not sufficient to cause serious tripping problems. But, in some cases, such as incandescent lamps, mercury arc lamps, metal halide and sodium vapour, or other large starting-current equipment, the proper selection should be considered.

Upon supply of a lighting installation, for a brief period an initial current exceeding the rated current (corresponding to the power of the lamps) circulates on the network. This possible peak has a value of approximately 15 ÷ 20 times the rated current, and is present for a few milliseconds; there may also be an inrush current with a value of approximately 1.5 ÷ 3 times the rated current, lasting up to some minutes. The correct dimensioning of the switching and protection devices must take these problems into account. Generally, it is recommended to make the maximum operating current not to exceed 80% of the related current.

Application Protection of resistance welding circuits

Short circuit protection for resistance welding devices can be obtained by applying molded case circuit breaker properly. These breakers permit normally high welding currents, but trip instantaneously if a short circuit develops.

It's recommended to select proper circuit breaker according to the characteristics of welding devices as the follow table.

Characteristics of welding device		Applied circuit breaker (MCCB 2P)	
Capacity (kVA)	Maximum input (kVA)	220V (Single phase)	400V (Single phase)

Application Use of circuit-breakers for capacitor banks

Application for protection of capacitor circuit

In order to reduce system losses (less than 0.5W/kvar in low voltage) and voltage drops in the power distribution system, reactive power compensation or power factor correction is generally undertaken. As a result, the power fed into the system is used as active power and costs will be saved through a reduction in the capacitive and inductive power factors. The compensation can be carried out by the fixed capacitors and automatic capacitor banks. However, the disadvantages of installing capacitors are sensitivity to over-voltages and to the presence of nonlinear loads.

Examples of equipment which consume reactive energy are all those receivers which require magnetic fields or arcs in order to operate, such as:

- Asynchronous motors: An asynchronous motor is a large consumer of inductive reactive energy. The amount of reactive power consumed is between 20% and 25% of the rated power of the motor (depending on its speed).
- Power Transformers: Power transformers are normally always connected. This means that reactive energy is always consumed. Also, as a consequence of its inductive nature, the reactive energy increases when the transformer is loaded.
- Discharge lamps, Resistance-type soldering machines, Dielectric type heating ovens, Induction heating ovens, Welding equipments, Arc furnaces

At the instant of closing a switch to energize a capacitor, the current is limited only by the impedance of the network upstream of the capacitor, so that high peak values of current will occur for a brief period, rapidly falling to normal operating values.

According to the relevant standards IEC 60831-1/IEC 70, capacitors must function under normal operating conditions with the current having a RMS value up to 1.3 times the rated current of the capacitor. Additionally, a further tolerance of up to 15% of the real value of the power must be taken into consideration. The maximum current with which the selected circuit-breaker can be constantly loaded, and which it must also be able to switch, is calculated as follows:

$$\text{Maximum expected rated current} = \text{Rated current of the capacitor bank} \times 1.5 \text{ (RMS value)}$$

Usual connection diagram

Application Using circuit-breakers in DC networks

Susol circuit-breakers for protection of power distribution with thermal overload and magnetic short-circuit trip units are suitable for usage in DC networks.

The circuit-breakers with electronic overcurrent releases are not suitable for DC networks.

Circuit-breaker selection criteria

The followings are the most important criteria for selection of suitable circuit breaker for DC networks.

- The rated current determines the rating and size of the circuit-breaker (Equipment)
- The rated voltage determines the number of poles in series necessary for breaking
- The maximum short-circuit current at the connection point determines the breaking capacity

Setting range of the trip values

- Thermal overload protection: Same setpoints as in 50/60Hz circuits
- Instantaneous short-circuit protection: The response threshold increases by maximum 40%.

The following wiring diagrams are recommended since the current must flow through all current paths in order to conform to the thermal tripping characteristic curve.

	Model	Trip unit	Applicable to DC circuits	Breaking capacity (kA)

Application Circuit breakers for 400Hz networks

When circuit breakers are used at high frequencies, the breakers in many cases require to be derated as the increased resistance of the copper sections resulting from the skin effect produced by eddy currents at 400Hz.

- Standard production breakers can be used with alternating currents with frequencies other than 50/60 Hz (the frequencies to which the rated performance of the device refer, with alternating current) as appropriate derating coefficients are applied.

Thermal magnetic trip units

Thermal trip

As can be seen from the data shown in below, the tripping threshold of the thermal element (I_{th}) decreases as the frequency increases because of the reduced conductivity of the materials and the increase of the associated thermal phenomena.

Rated current (A) at 400Hz= $K_1 \times$ rated current (A) at 50/60Hz

Instantaneous trip

The magnetic threshold increases with the increase in frequency.

Instantaneous current (A) at 400Hz= $K_2 \times$ Instantaneous current (A) at 50/60Hz

Thermal magnetic trip units

Application Protection of several kinds of loads

Application for protection of several kinds of loads

It requires to select proper circuit breakers according to the characteristics of loads when they are installed to protect several kinds of loads. It's needed to consider the maximum operating current and the capacity of loads in total so as to select the rated current of breakers.

Selection of circuit breaker protecting the several loads simultaneously

The kind of loads (IM: motors, IL: others)	Permissible current in cable or wire: Iw	The rated current of circuit breaker: Ib
In case of, $\sum IM \leq \sum IL$ 	$Iw \geq \sum IM + \sum IL$	Choose the low value among two formulas: $Ib \geq 3 \sum IM + \sum IL$ and $Ib \leq 2.5Iw$
In case of, $\sum IM > \sum IL$, $\sum IM \leq 50A$ 	$Iw \geq 1.25 \sum IM + \sum IL$	It's permitted to select the above value only if Iw (above 100A) isn't subject to the rated current of circuit breaker.
In case of, $\sum IM > \sum IL$, $\sum IM > 50A$ 	$Iw \geq 1.1 \sum IM + \sum IL$	

The rated current of breakers as the main circuit of 3 phase inductive loads (AC 220V)

Capacity of loads In total (below kW)	The maximum operating current (below A)	Capacity of the highest motor (kW / A)

Protective coordination Discrimination & Cascading

The primary purpose of a circuit protection system is to prevent damage to series connected equipment and to minimize the area and duration of power loss. The first consideration is whether an air circuit breaker or molded case circuit breaker is the most suitable. The next is the type of system to be used. The two major types are: Discrimination and cascading.

Discrimination

According to IEC60947-2, the discrimination can be defined as follows.

Total discrimination (total selectivity)

Over-current discrimination where, in the presence of two over-current protective devices in series, the protective device on the load side effects the protection without causing the other protective device to operate.

Partial discrimination (partial selectivity)

Over-current discrimination where, in the presence of two over-current protective devices in series, the protective device on the load side effects the protection up to a given level of over-current, without causing the other protective device to operate.

No discrimination

In case of a fault, main and branch circuit breakers open.

Cascading

This is an economical approach to the use of circuit breakers, whereby only the main (upstream) breaker has adequate interrupting capacity for the maximum available fault current.

The MCCBs downstream cannot handle this maximum fault current and rely on the opening of the upstream breaker for protection.

The advantage of the cascade back-up approach is that it facilitates the use of low cost, low fault level breakers downstream, thereby offering savings in both the cost and size of equipment.

As Susol TD & TS circuit breakers have a very considerable current limiting effect, they can be used to provide this 'cascade back-up' protection for downstream circuit breakers.

How to calculate short-circuit current value Various short-circuit

The purpose of calculating short circuit values

- Selection of circuit breakers, fuse.
- Adjusting metering devices
- Consideration for mechanical resistance
- Consideration for thermal resistance

Various value of short-circuit current should be applied to the tests for upper factors.

Symmetrical current for AC and asymmetrical current for DC are used for classifying short circuit current.

Their differences should be essentially considered in the basic step of making network plan.

Symmetrical short-circuit current real value

Short-circuit current is composed of AC and DC as it shows on <Fig.1>. The short-circuit which indicates the real value of AC is called as symmetrical short-current real value, $I_{(rms)sym}$. This current is the essential factor of selecting MCCB, ACB, fuse.

<Fig.1> Composition of short-circuit current

Maximum asymmetrical short-circuit current real value: $I_{(rms)asym}$

The short-circuit which indicates the real value of DC is called as asymmetrical short-circuit current real value.

And this current value is changeable upon the short-circuit closing phase.

This current value is treated for checking the thermal resistant strength of wrings, CT and etc.

With symmetrical short-circuit current real value and short-circuit power factor, we can achieve the value, α from <Fig.5>. and maximum asymmetrical short-circuit current real value is calculated with this formula.

$$I_{(rms)asym} = \alpha I_{(rms)sym}$$

3-phases average asymmetrical short-circuit current real value: $I_{(rms)ave}$

Each phase is different in its input current value in 3 phases circuit. So that AC rate for 3 phases is different. This value is the average of asymmetrical short-circuit current of 3 phases. And with symmetrical short-circuit current real value and short-circuit power factor, we can achieve the value, β , and 3-phases average asymmetrical short circuit current real value is calculated with this formula.

$$I_{(rms)ave} = \beta I_{(rms)sym}$$

Maximum asymmetrical short-circuit current instantaneous value: I_{max}

Each phase has different instantaneous current value. And when asymmetrical short-circuit current shows its maximum instantaneous value, the current value is called as maximum asymmetrical short-circuit current instantaneous value. This current is to test the mechanical strength of serial equipments.

And with symmetrical short-circuit current real value and short-circuit power factor, we can achieve the value, γ and maximum asymmetrical short-circuit current instantaneous value is calculated with this formula.

$$I_{max} = \gamma I_{(rms)sym}$$

Network impedance for calculating short-circuit current value

Bellows should be considered for the calculation as the impedance components affecting circuit to trouble spot from short-circuit power.

a. Primary part impedance of incoming transformer It's calculated from the short-circuit current data which is provided by power supplier. Calculated value can be regarded as reactance.

b. Impedance of incoming transformer Its amount is upon the capacity of transformer and primary voltage. Generally this impedance can be regarded as reactance and refer to <Table.4>, <Table.5>.

Technical information

Susol

How to calculate short-circuit current value Various short-circuit

c. Reactance of motor

Motor works as generator and supply short circuit current in the condition of an accident circuit such as <Fig.2>.

Generation factor of firm motor should be considered in a low voltage circuit where a circuit breaker operates quickly and in a high voltage circuit for the selection of fuse. Reactance of motor can be regarded in the range of 25% normally.

d. Distribution impedance

Impedance of cable and busduct do control short-circuit remarkably in low voltage network. Refer to <Table.5>, <Table.6>.

e. Others

MCCB, ACB CT are equipments for the network of low voltage.

The impedance of these equipment which is calculated from short-circuit current value should be considered.

Generally, the impedance of those equipment is that of rated current (normal condition), if operators apply that impedance value, bigger reactance value may be applied to calculated short-circuit current value.

<Fig.2> Short-circuit of motor

Technical information

Susol

How to calculate short-circuit current value With percent impedance

Ohm formula (Ω), percent impedance formula (%), unit formula (per unit) can be applied to calculate short-circuit current value.

Ohm formula [Ω]

Short-circuit current value is calculated by converting into ohm value [Ω]

Percent impedance formula (%) Each impedance is converted into the impedance of base value and base voltage.

And the required amount for electric demand should be shown as percent unit.

And apply that value in ohm formula.

Unit formula

The base value equals 1.0, and all value of network shows in the way of decimal system. Applying any of upper calculation formulas to achieve short-circuit current value, it shows equal value. To select a certain formula for doing it, operator can select one of those formula which is proper to oneself. Below is percent impedance formula.

Finding base value

The rated current of transformer shall be the base value.

Base capacity $P_B = P_T$ [kVA]

Base voltage $V_B = V_T$ [V]

$$\text{Base current } I_B = I_T = \frac{P_T}{\sqrt{3}V_T} \times 10^3 [\text{A}]$$

$$\text{Base impedance } Z_B = \frac{V_B^2}{P_B \times 10^3} = \frac{V_T^2}{P_T \times 10^3} [\Omega]$$

<Fig.3> Base value

Converting impedance into base value

a. Primary part impedance of transformer: % X_1

$$\%X_1 = \frac{P_B}{Q \times 10^3} \times 100 [\%]$$

Q: Primary part short-circuit capacity

b. Impedance of transformer: % Z_T

It generally indicates as percent impedance. If base capacity is equal to transformer capacity, % Z_T can be used as it is. When base capacity is not equal to transformer capacity, convert values by this formula.

$$\frac{P_T}{\%Z_T} = \frac{P_B}{\%Z_s}$$

%: value converted by base value

1phase transformer should converted into the value of 3 phase transformer. And the percent impedance is equal to $\frac{\sqrt{3}}{2} \times$ calculated urgent value.

c. Reactance of motor: % X_m

Transformer capacity shows the value in kW, so it is converted into unit, kVA.
(kVA value) $\approx 1.5 \times (\text{Output of motor, kW})$
% $X_m = 25\%$ Converting it from base capacity

$$\frac{P_m}{\%X_m} = \frac{P_B}{\%X_m}$$

(Converting formula for different capacity)

d. Impedance of busduct, cable

Cable: Area of cross-section & length
Busduct: Rated current

In <Fig.5>, <Fig.6>

$Z_c = (\Omega \text{ per each unit length}) \times (\text{length}) [\Omega]$
Convert this value into % value.

$$\%Z_c = \frac{Z_c}{Z_B}$$

(% converting formula)

2cables in same dimension, it's recommendable to divide the length by 2.

Technical information

Susol

How to calculate short-circuit current value

Preparing a impedance map

Prepare impedance map according to the impedance value from (2). Various electricity suppliers like source, motor have same electric potential in impedance map.

As you find it on <Fig.4> (a), extend it from the unlimited bus to fault point, draw impedance map.

Calculating impedance

Calculate impedance as <Fig.4 (b)> in impedance map < Fig.4 (a)>

$$\%Z = \%R + j \%X$$

$$\%Z = \sqrt{(\%R)^2 + (\%X)^2}$$

Calculating symmetrical short-circuit current real value

<Fig.4> Base value

Calculating various short-circuit current value

$$I_F(3\phi) = I_F(\text{rms})_{\text{sym}}(3\phi)$$

$$\begin{aligned} &= \frac{P_B \times 10^3}{\sqrt{3}V_B \cdot \%Z} \times 100 \\ &= \frac{I_B}{\%Z} \times 100 [\text{A}] \end{aligned}$$

Calculate various short-circuit current value with α , β , γ values from <Fig.5> like

$$\text{short-circuit power factor } \cos \phi = \frac{\%R}{\%Z}$$

3 phases average asymmetrical real value

$$I_F(\text{rms})_{\text{ave}} = \beta I_F(\text{rms})_{\text{sym}}$$

Maximum average asymmetrical real value

$$I_F(\text{rms})_{\text{asym}} = \Omega I_F(\text{rms})_{\text{sym}}$$

Maximum asymmetrical instantaneous value

$$I_F_{\max} = \gamma I_F(\text{rms})_{\text{sym}}$$

In case of 1 phase short-circuit

Current value from (5) multiplied by $\frac{\sqrt{3}}{2}$

Each short-circuit current value (1ϕ) = $\frac{\sqrt{3}}{2}$ (3phases short-circuit current) $\times \alpha$ (or γ)

<Fig.5>

Technical information

Susol

How to calculate short-circuit current value With a simple formula

For its special cases, calculating exact value should be needed, in the other hand, for the practical use, we recommend simple formula.

Finding a base value

It shall be the rated current of transformer.

$$P_B = PT \text{ [kVA]}$$

$$V_B = VT \text{ [V]}$$

$$I_B = IT \text{ [A]}$$

$$Z_B = \frac{V_T B}{P_T \times 10^3}$$

<Fig.6> Base value

Short-circuit current from incoming circuit

Disregard the impedance value of primary part of transformer. Calculate short-circuit current value according to <Fig.7>.

(If the impedance value of primary part of transformer is considered, calculate the current value as below formula)

$$I_A (R) = \frac{I_B}{\sqrt{(\%R_T)^2 + (\%X_1 + \%X_T)^2}} \times 100 \text{ [A]}$$

$$\%X_1 = \frac{P_B}{Q \times 10^3} \times 100 \text{ [%]}$$

If the value of $\%R_T$ is not clear, $\%Z_T = \%T_T$

$$I_A (R) = \frac{I_B}{\sqrt{\%X_1 + \%X_T}} \times 100 \text{ [A]}$$

Ref 1) Calculation in the random voltage E Voltage line which is mostly close to E shall be selected to calculate it . i.e. in case of 220V, (200V line value) ÷ 200/220

Ref 2) Calculation for a certain impedance Zt (%) Impedance line which is mostly close to Zt (%) shall be selected to calculate it . i.e. 420V, Zt = 4.5%

$$\%Z = 4\% \text{ Line value (or 5% line)} \times 4 \text{ (or 5)/4.5}$$

Ref 3) When the value is out of lines or over 200VA or below 100kA, multiply 10 times to the calculated values.

<Fig.7> Transformer capacity and short-circuit current

Short-circuit current to motor

$$I_A (M) = 4 \times \Sigma \text{ (Rated current of motor)}$$

Symmetrical short-circuit current at point A

$$I_A = I_A (R) + I_A (M)$$

Decreasing coefficient caused by busduct

$$\text{Obtaining the value of } \frac{l \cdot I_A}{10VT}$$

Calculate decreasing coefficient from <Fig.10>

Decreasing short-circuit current by reactance

When there's 1phase transformer in a certain circuit, calculate it in the base of reactance.

Regarding the reactance as pre-impedance at source part at point of <Fig.8>,

$$X_C = \frac{E_B}{\sqrt{3} I_C}$$

Reactance C~D: $X_D [\Omega]$ (impedance of 1 $\emptyset T$)

Technical information

Susol

How to calculate short-circuit current value

Calculating the value of X_D/X_C and decreasing coefficient d from the reactance of <Fig.9>.

Current at point D $I_D = d \cdot I_C$

Impedance of 1 phase transformer $X_D = X(1\phi) \frac{1}{2}$

a. Short-circuit current at E_C voltage base

$$I_D(\text{rms})\text{sym} \cdot 3\phi = d \cdot I_C(\text{rms})\text{sym} \cdot 3\phi$$

b. Short-circuit current at E_D voltage base

$$I_D(\text{rms})\text{sym} \cdot 3\phi = d \cdot I_C(\text{rms})\text{sym} \cdot 3\phi \cdot E_C/E_D$$

<Fig.9> Decreasing coefficient of short-circuit current by reactance: d

Coefficient d for cables

Calculating the value of $\frac{I_F}{10V_T}$

Decreasing coefficient b value is calculated from <Fig.13>. For insulator drawn wrings, we can find the value directly from <Fig.13>.

Calculating symmetrical short-circuit current real value

$$I_F(\text{rms})\text{sym} = b \times I_D[D]$$

Various short-circuit current

In case of having short-circuit current power factor, find α , β , γ from <Fig.5>, If not find 3 values from <Table.1>

- 3 phases short-circuit asymmetrical current average value
 $I_F(\text{rms})\text{ave} = \beta I_F(\text{rms})\text{sym}$
- Maximum asymmetrical real value
 $I_F(\text{rms})\text{ave} = \alpha I_F(\text{rms})\text{sym}$
- Maximum asymmetrical instantaneous value
 $I_F(\text{rms})\text{ave} = \gamma I_F(\text{rms})\text{sym}$

<Table.2> α , β , γ values when short circuit power factor value is not definite.

Symmetrical short-circuit real value (A)	Variables		
	Maximum asymmetrical real value	3 phases short-circuit asymmetrical current average value	Maximum asymmetrical instantaneous value
2500	1.0	1.0	1.48
2501~5000	1.03	1.02	1.64
5001~1000	1.13	1.07	1.94
1001~15000	1.18	1.09	2.05

How to calculate short-circuit current value Calculation example

Calculation1) Short-circuit current value will be achieved by simple formula and percent impedance formula for <Fig.13>

<Fig.13>

Percent impedance formula

(1) Base value

$$P_B = 750 \text{ kVA} \quad V_B = 420 \text{ V}$$

$$I_B = 1031 \text{ A} \quad Z_B = 0.237 \Omega$$

(2) Each impedance

a. Reactance at primary part of transformer

$$\%X_1 = \frac{750}{1000 \times 10^3} \times 100 = 0.075 [\%]$$

b. Impedance of transformer

$$\%R_T = 1.4\%$$

$$\%X_T = 4.8\%$$

c. 1 Ø Tr impedance

$$\%R_{T1} = \frac{1.15 \times 750}{20} \times \frac{1}{2} = 21.6 [\%]$$

$$\%X_{T1} = \frac{1.68 \times 750}{20} \times \frac{1}{2} = 31.5 [\%]$$

d. Reactance of transformer

$$\%X_{m1} = \frac{750}{120 \times 1.5} \times 25 = 104 [\%]$$

$$\%X_{m2} = \frac{750}{140 \times 1.5} \times 25 = 89 [\%]$$

$$\%X_{m3} = \frac{750}{100 \times 1.5} \times 25 = 125 [\%]$$

$$\%X_{m4} = \frac{750}{115 \times 1.5} \times 25 = 108.7 [\%]$$

e. Impedance of cable

Converting impedance of whole metal tube

$$[2 \times 100 \text{ mm}^2 \quad 10 \text{ m}]$$

$$\%R_{c1} = \frac{0.00018 \times 10}{0.237} \times \frac{1}{2} \times 100 = 0.38 [\%]$$

$$\%X_{c1} = \frac{0.00013 \times 10}{0.237} \times \frac{1}{2} \times 100 = 0.27 [\%]$$

$$[125 \text{ mm}^2 \quad 20 \text{ m}]$$

$$\%R_{c2} = \frac{0.00014 \times 20}{0.237} \times 100 = 1.18 [\%]$$

$$\%X_{c2} = \frac{0.00013 \times 20}{0.237} \times 100 = 1.09 [\%]$$

$$[250 \text{ mm}^2 \quad 50 \text{ m}]$$

$$\%R_{c3} = \frac{0.00007 \times 50}{0.237} \times 100 = 1.47 [\%]$$

$$\%X_{c3} = \frac{0.00013 \times 50}{0.237} \times 100 = 2.74 [\%]$$

$$[14 \text{ mm}^2 \quad 30 \text{ m}]$$

$$\%R_{c4} = \frac{0.00013 \times 30}{0.237} \times 100 = 16.45 [\%]$$

$$\%X_{c4} = \frac{0.00015 \times 30}{0.237} \times 100 = 1.88 [\%]$$

Technical information

Susol

How to calculate short-circuit current value

- (3) Preparing a impedance map
Connect short-circuit supplier to the unlimited bus.

Calculating impedance
Calculate it in serial/parallel type formula

a. Fault point F₁

$$\begin{aligned} \%Z_1 &= \sqrt{(2.57)^2 + (5.53)^2} & \%Z_2 &= \sqrt{(39.06)^2 + (37.55)^2} \\ &= 6.1[\%] & &= 54.2[\%] \end{aligned}$$

b. Fault point F₂

- (5) Calculation of asymmetrical short-circuit current

a. Fault point F₁

$$\begin{aligned} I_{F1} (\text{rms})\text{sym} &= \frac{1031}{6.1} \times 100 = 16900 [\text{A}] \\ \cos \phi_1 &= \frac{2.57}{6.1} = 0.422 \end{aligned}$$

b. Fault point F₂ (1 phase circuit)

$$\begin{aligned} I_{F2} (\text{rms})\text{sym} &= \frac{1031}{54.2} \times 100 = 1902 [\text{A}] \dots (\text{at } 100\text{V}) \\ &= \frac{1031}{54.2} \times 100 \times \frac{420}{100} = 7989 [\text{A}] \dots (\text{at } 420\text{V}) \end{aligned}$$

I_{F2} (rms)sym is short-circuit current.
Therefore, convert it into 1 phase short-circuit current.

$$I_{F2} (\text{rms})1 \Omega \text{ sym} = 7989 \times \frac{\sqrt{3}}{2} = 6919 [\text{A}]$$

$$\cos \phi_2 = \frac{39.06}{54.2} = 0.72$$

- (6) Various short-circuit current
Calculate α , β , γ from <Fig.5>.

a. Fault point F₁

$$\cos \phi_1 = 0.422$$

$$\alpha = 1.05 \quad \beta = 1.3 \quad \gamma = 1.74$$

$$I_{F1} (\text{rms})\text{ave} = 1.03 \times 16900 = 17407 [\text{A}]$$

$$I_{F1} (\text{rms})\text{asym} = 1.05 \times 16900 = 17745 [\text{A}]$$

$$I_{F1} \text{max} = 1.74 \times 16900 = 29406 [\text{A}]$$

b. Fault point F₂

$$\cos \phi_2 = 0.72$$

$$\alpha = 1.0 \quad \beta = 1.48$$

$$I_{F2} \text{1 } \emptyset \text{ (rms)asym} = 1.0 \times 6919 [\text{A}]$$

$$I_{F2} \text{1 } \emptyset \text{ max} = 1.48 \times 6919 = 10240 [\text{A}]$$

Simple calculation formula

- (1) Base value

$$\begin{aligned} P_B &= 750 \text{kVA} & V_B &= 420 \text{V} \\ I_B &= 1031 \text{A} & Z_B &= 0.237 \Omega \end{aligned}$$

- (2) Short-circuit current of incoming circuit

Disregard the impedance of primary part of transformer
In <Fig.7> $I_{A(R)} = 20500 \text{ A}$

- (3) Short-circuit current of motor

$$\text{Sum of motor capacity} = (120+140+100+115) \times 1.5 = 713 [\text{kVA}]$$

$$I_{A(M)} = \frac{713}{\sqrt{3} \times 420} \times 4 = 3920 [\text{A}]$$

- (4) Symmetrical short-circuit current at point A
 $I_A = 20500 + 3920 = 24420 [\text{A}]$

Technical information

Susol

How to calculate short-circuit current value Calculation example

(5) Decreasing short-circuit current for cable

a. At point F₁

$$\bullet 2 \times 100\text{mm}^2 10\text{m}$$

$$2 \times 100\text{mm}^2 10\text{m} = 100\text{mm}^2 5\text{m}$$

$$\frac{l I_A}{10E} = \frac{20 \times 24420}{10 \times 420} = 29.1$$

Coefficient b= 0.935

Short-circuit current value at point C

$$I_C (\text{rms}) \text{sym}= 0.935 \times 24420 = 22850 [\text{A}]$$

$$\bullet 125\text{mm}^2 20\text{m}$$

$$\frac{l I_C}{10E} = \frac{20 \times 22850}{10 \times 420} = 108.9$$

$$I_{F1} (\text{rms}) \text{sym}= 0.785 \times 244850 = 17940 [\text{A}]$$

b. At point F₁

$$\bullet 14\text{mm}^2 30\text{m}$$

$$\frac{l I_C}{10E} = \frac{30 \times 24420}{10 \times 420} = 174.4$$

Coefficient b= 0.249

$$I_B (\text{rms}) 3\varnothing \text{sym}= 0.24 \times 24420 = 6080 [\text{A}]$$

• Decreasing by the reactance (1 Ø Tr)dp

Convert the value of '%X of 1 Ø Tr' to base capacity

$$X_D = 750 \times 2/20 = 75\%$$

Impedance of primary part at 1 Ø Tr

$$X_A = \frac{I_B}{I_D} \times 100 = \frac{1031}{6080} \times 100[\%]$$

Convert X_A to equivalent 3 phases, and

$$\frac{X_D/2}{X_A} = \frac{750 \times 2 \times 6080}{20 \times 2 \times 1031 \times 100} = 2.21$$

Coefficient d of <Fig.9> d= 0.32

$$I_{F2} (\text{rms}) 3\varnothing \text{sym}= 0.32 \times 6080 = 1945 [\text{A}] (400V)$$

$$= 0.32 \times 6080 \times 420/100$$

$$= 817 [\text{A}] (100V)$$

$$\therefore I_{F2} (\text{rms}) 1\varnothing \text{sym}= 8171 \times \frac{\sqrt{3}}{2} = 7076 [\text{A}]$$

(6) Various short-circuit current

Find α, β, γ from <Table.1>

a. At point F₁

$$\alpha= 1.25 \quad \beta= 1.13 \quad \gamma= 2.17$$

$$IF1 (\text{rms}) \text{ave}= 1.13 \times 17940 = 20272 [\text{A}]$$

$$IF1 (\text{rms}) \text{asym}= 1.25 \times 17940 = 22425 [\text{A}]$$

$$IF1 \text{max}= 2.17 \times 17940 = 38930 [\text{A}]$$

b. At point F₂

$$\alpha= 1.13 \quad \gamma= 1.94$$

$$IF2 1\varnothing (\text{rms}) \text{asym}= 1.13 \times 7076 = 7945 [\text{A}]$$

$$IF2 1\varnothing \text{max}= 1.94 \times 7076 = 13727 [\text{A}]$$

<Table.2> Comparison of short-circuit

How to calculate short-circuit current value

Short-circuit current value will be achieved by simple formula for <Fig.16>

<Fig.16>

(1) Calculate rated current at each point
 ① Rated current I_{nA} at point A

$$I_{nA} = \frac{500[\text{kVA}] \times 1000}{\sqrt{3} \times 6.6[\text{kV}] \times 1000} = 43.7[\text{A}]$$

② Rated current I_{nB} at point B

$$I_{nB} = \frac{100[\text{kVA}] \times 1000}{\sqrt{3} \times 3.3[\text{kV}] \times 1000} = 17.5[\text{A}]$$

$$I_{nC} = \frac{20[\text{kW}] \times 1000}{\sqrt{3} \times 220[\text{V}] \times 0.85 \times 0.8} = 77.2[\text{A}]$$

(2) Put 1000k VA for base capacity and calculate short-circuit current at each point.

① Short-circuit current I_{SA} at point A
 a) Impedance Map

b) Short-circuit I_{SA}

$$I_{SA} = \frac{1000[\text{kVA}] \times 1000 \times 100}{\sqrt{3} \times 6.6[\text{kV}] \times 1000 \times 0.25\%} = 34990[\text{A}]$$

* Breaking capacity of breaker [MVA]
 $MVA = 3$ short-circuit current[kA] line to line voltage[kV]

② Short-circuit current at point B: I_{SB}

a) Impedance Map

* Serial sum of impedance
 $Z_{tot} = 0.25 + 0.01 + 8 = 8.26 [\%]$

b) Short-circuit current I_{SC}

$$I_{SB} = \frac{1000[\text{kVA}] \times 1000 \times 100}{\sqrt{3} \times 3.3[\text{kV}] \times 1000 \times 8.26} = 2118[\text{A}]$$

* Breaking capacity of breaker [MVA]
 $MVA = \sqrt{3}$ short-circuit current [kA] line to line voltage [kV]

③ Short-circuit current at point C: I_{SC}

a) Impedance Map

* Parallel sum of impedance

$$Z = \frac{1}{\frac{1}{33.26} + \frac{1}{2001} + \frac{1}{8001}} = 32.58 [\%]$$

b) Short-circuit current I_{SC}

$$I_{SC} = \frac{1000[\text{kVA}] \times 1000 \times 100}{\sqrt{3} \times 220[\text{V}] \times 32.58 [\%]} = 8055 [\text{A}]$$

Calculation formula

Rated current $I_n = \frac{\text{Transformer capacity}}{\sqrt{3} \times \text{Rated voltage}}$

Short-circuit current $I_s = \frac{\text{Transformer capacity} \times 100}{\sqrt{3} \times \text{Rated voltage} \times \%Z}$

38mm²				0.00048
50mm²				0.00037
60mm²				0.00030
80mm²				0.00023
100mm²				0.00018
125mm²	0.00013	0.00009	0.00022	0.00014
150mm²				0.00012
200mm²				0.00009
250mm²				0.00007
325mm²				0.00005

<Remark1> At 60Hz, the reactance multiply 2 times itself, so 1/2 reactance of primary part can achieve IB.

<Remark2> When the cable is parallelly 2 or 3ea, reactance and resistance can be calculated in the condition of 1/3 and 1/3 length cable.

How to calculate short-circuit current value Calculation example

Using a certain graph, you can find and calculate the short-circuit current value which is at one position of network. No matter the condition of network is different, you can do the calculation through adjusting variables.

Graph note

- P coordinates – Transformer capacity (kVA)
- Is_1 coordinates – Short-circuit current value (kA)
- Is_2 coordinates – Short-circuit current value affected cable condition (kA)
- Ⓐ Line - % impedance of transformer (%)
- Ⓑ Line - Length of cable (m)
- Ⓒ Line - Square mm of cable (mm^2)
- Ⓓ Line - Is_2 (kA)

Remark) Ⓑ line shows the length of hard vinyl cable (600V IV)

How to calculate short-circuit current value

(1) 3 phases transformer

- ① Short-circuit current value at (A) where it is just below transformer. At P coordinates, find the coordinates value (g) of the cross point (f) which is from transformer capacity (e) and A line. Disregard primary part impedance of transformer.
- ② Find the short-circuit current value at Point B, C which are considered cable impedance.
 - At short-circuit current g (kA) of Is_1 coordinates, find the value (h) of B line
 - Move (h) to parallel direction of Is_1 , and find the cross point (i) to C line.
 - Move (i) to parallel direction of Is_2 , and find the cross point value (j) to D line (g), finally find (k) of Is_2

(2) 1 phase transformer

- ① Short-circuit current value where it is just below transformer. Find the value as same as that of 3 phase transformer and multiply it 3 times. ($g' \text{kA}$)
- ② Find the short-circuit current value where it is considered cable impedance.
 - Multiply 2/3 times to g' of Is_1 coordinates
 - Find the Is_2 value as same as that of 3 phase transformer and multiply it 3/2 times.

Remark

1. It's not considered the transformer contribution. Multiply 4 times the rated current of transformer in cases.
2. The real short-circuit current value is littler lower than its calculated value by the way we suggest because we take the rated voltage as AC200V, 400V. So the current value should be calculated in the consideration of stability
3. The calculated value is symmetrical real value.

How to calculate short-circuit current value Calculation graph

(1) Short-circuit current value at point A (I_{SA})

- At P coordinates, find (f) which is the point which is to match transformer capacity 500kVA and A line. Then move (f) to I_{S1} direction and finally find (g).
- $I_{SA} = 29\text{kA}$ (g)

(2) Short-circuit current value at point B (I_{SB})

- Find value h of B line (20mm) at g (= 29kA) of I_{S1} coordinates
- Move h parallelly to the direction of I_{S1} , and find value I at the cross point with C line (200mm)
- Move I parallelly to the direction of I_{S2} , and find value j at the cross point with D line (g= 29kA)
- $I_{SB} = 19\text{kA}$ (k)

Technical information

Susol

(3) Short-circuit current value at point C (I_{sc})

- Find I_{s1} coordinates value (19kA) of short-circuit current value k (= 19kA) at Point B. and find cross point m between 19kA and B line.
- Move m parallelly to the direction of I_{s1} coordinates, and find the cross point n at C line (30mm).
- Move n parallelly to the direction of I_{s2} and find the cross point p of I_{s2} with D line.
- $I_{sc} = 10\text{kA}$ (g)
