Meta solution

MCCB = ELCB

Upgrade of Meta-MEC series

...Metasol Low Voltage Circuit Breaker

- Ui = 1000V
- Uimp = 8kV

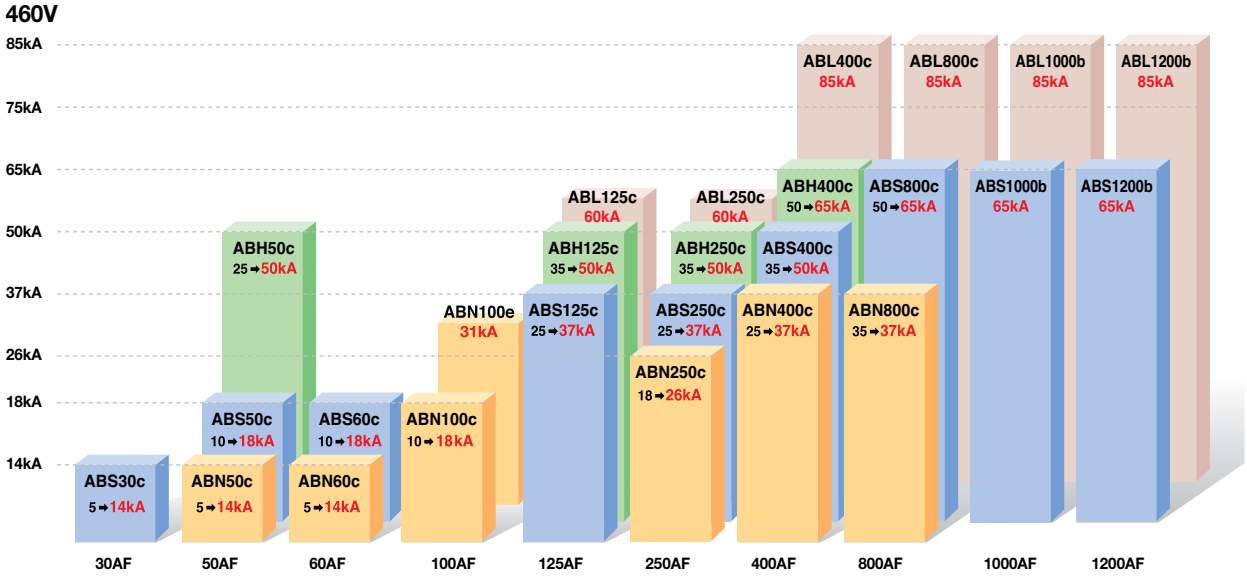
- *Compatible and differentiated design*
  - Compatible with the Meta-MEC
  - Outlook differentiated design
- *Same external dimension with MCCB and ELCB*
- *Upgrade the coordination*
  - Upgrade the coordination with Susol / Meta-MEC mass capacity

- *Upgrade breaking capacity*
  - N100AF : 10 ➡ 18kA
  - S125AF : 25 ➡ 37kA
  - S250AF : 25 ➡ 37kA
  - H250AF : 35 ➡ 50kA
  - N400AF : 25 ➡ 37kA
  - S400AF : 35 ➡ 50kA
  - S800AF : 50 ➡ 65kA

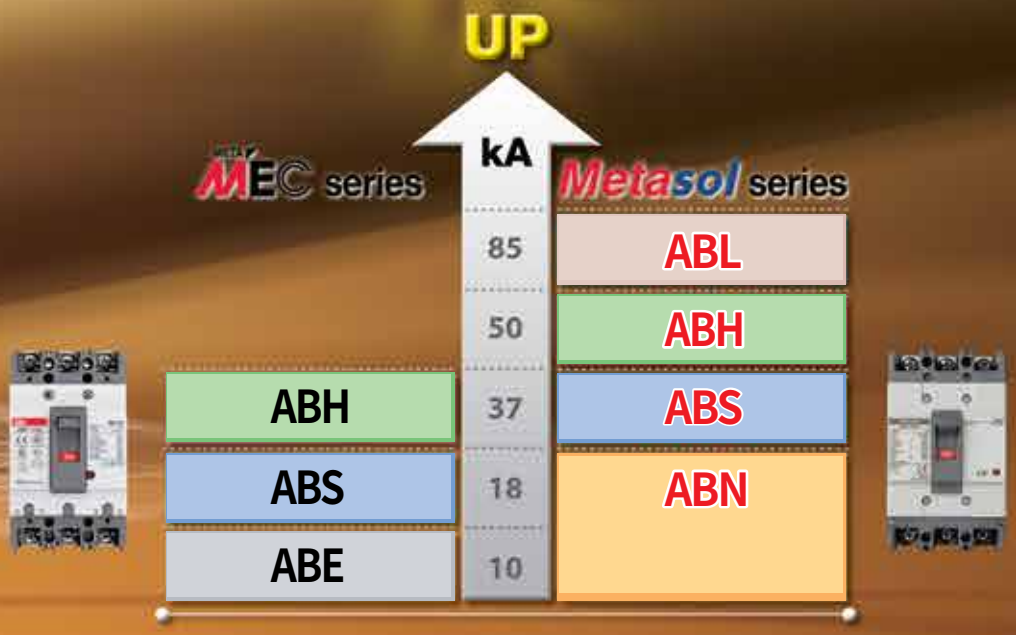
Metasol MCCB/ELCB

Metasol MCCB

Upgrade breaking capacity



Short-circuit breaking capacity

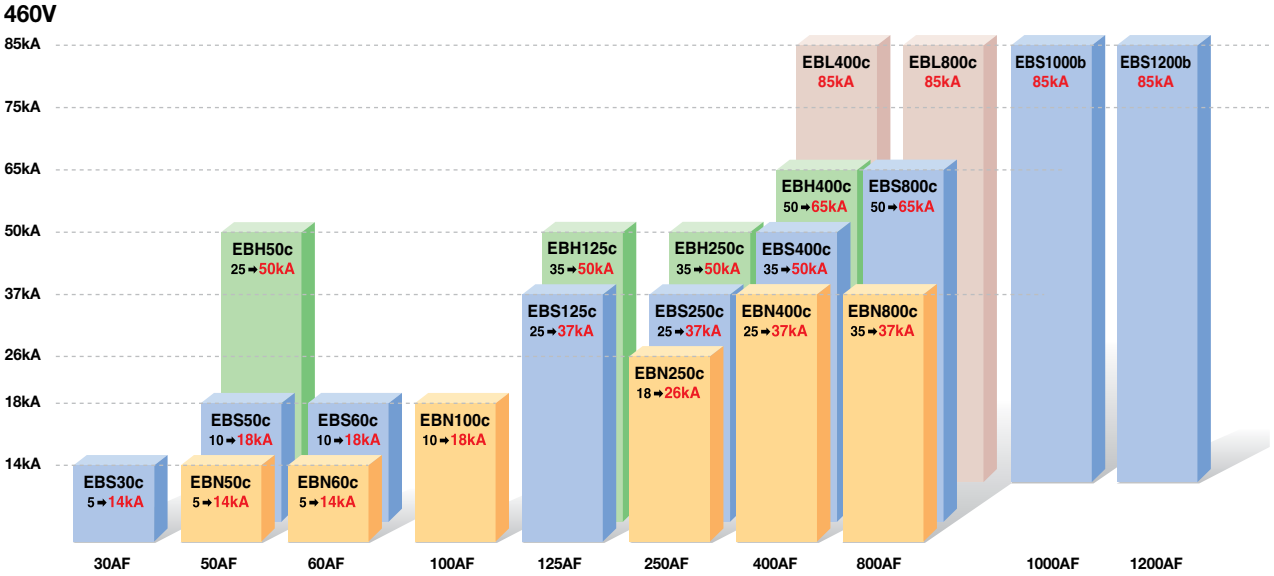


Upgrade breaking capacity

- N100AF : 10 ➡ **18kA**
- S125AF : 25 ➡ **37kA**
- S250AF : 25 ➡ **37kA**
- H250AF : 35 ➡ **50kA**
- N400AF : 25 ➡ **37kA**
- S400AF : 35 ➡ **50kA**
- S630AF : 50 ➡ **65kA**
- S800AF : 50 ➡ **65kA**

Metasol ELCB

Upgrade breaking capacity



Metasol MCCB/ELCB Compatible and standard

- 100% compatible with Meta-MEC series.
- Standardized dimension (Depth, cutout) when the panel is made.

Metasol MCCB

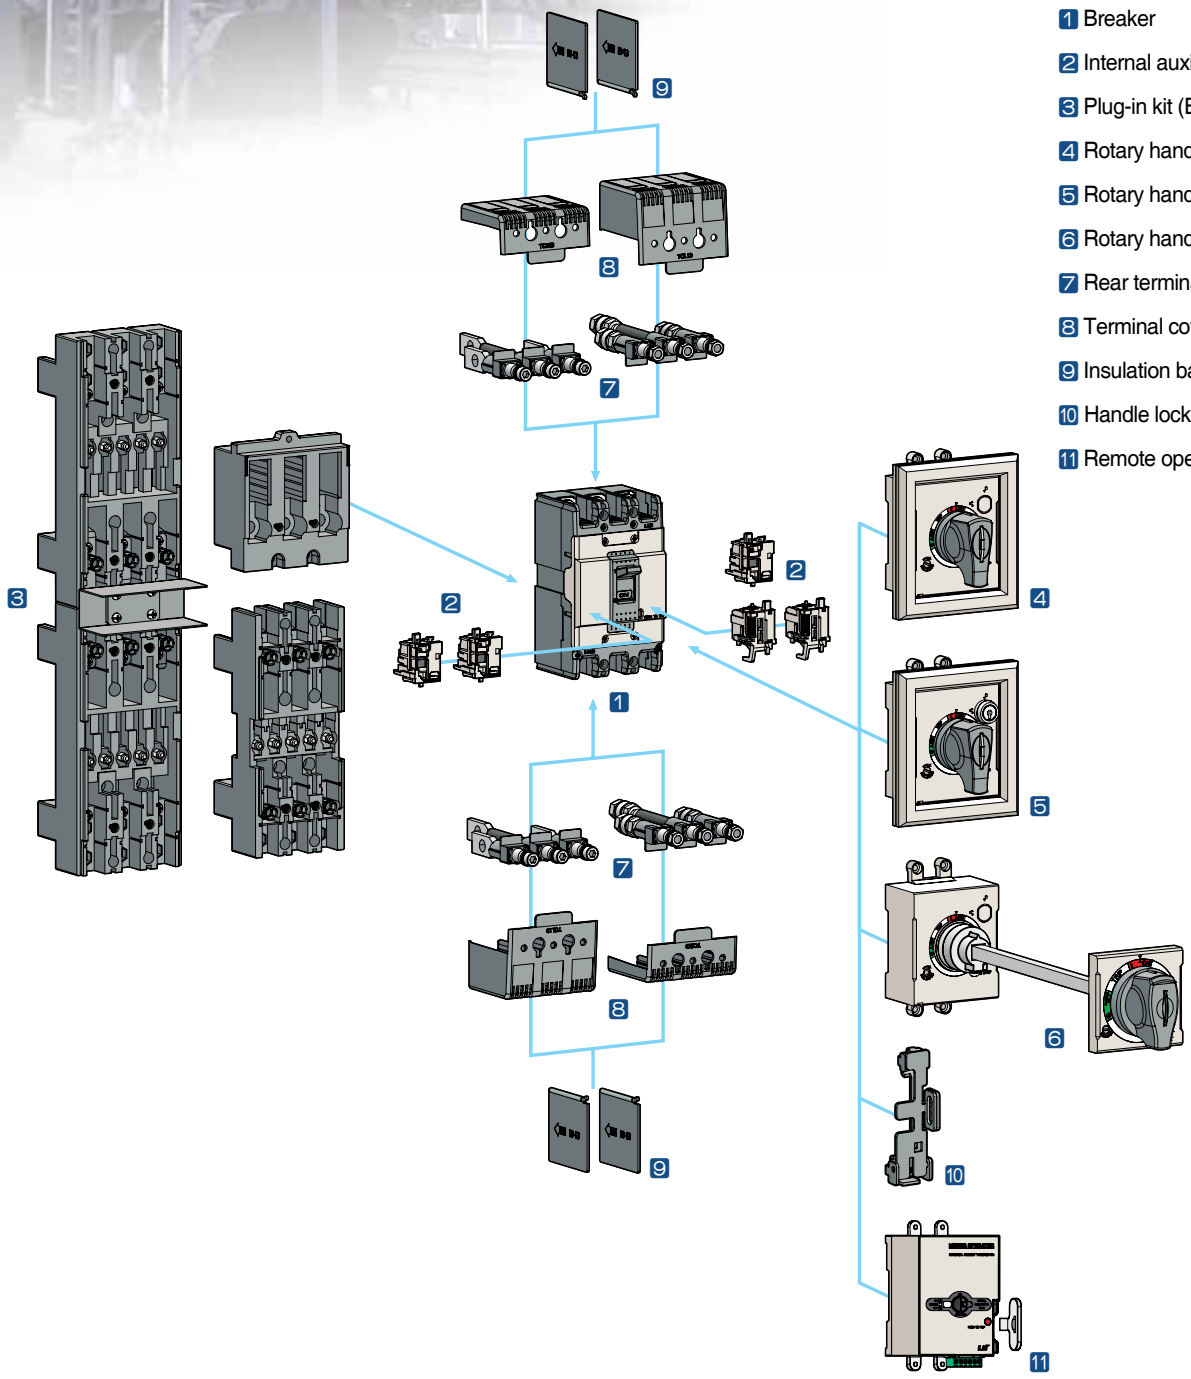
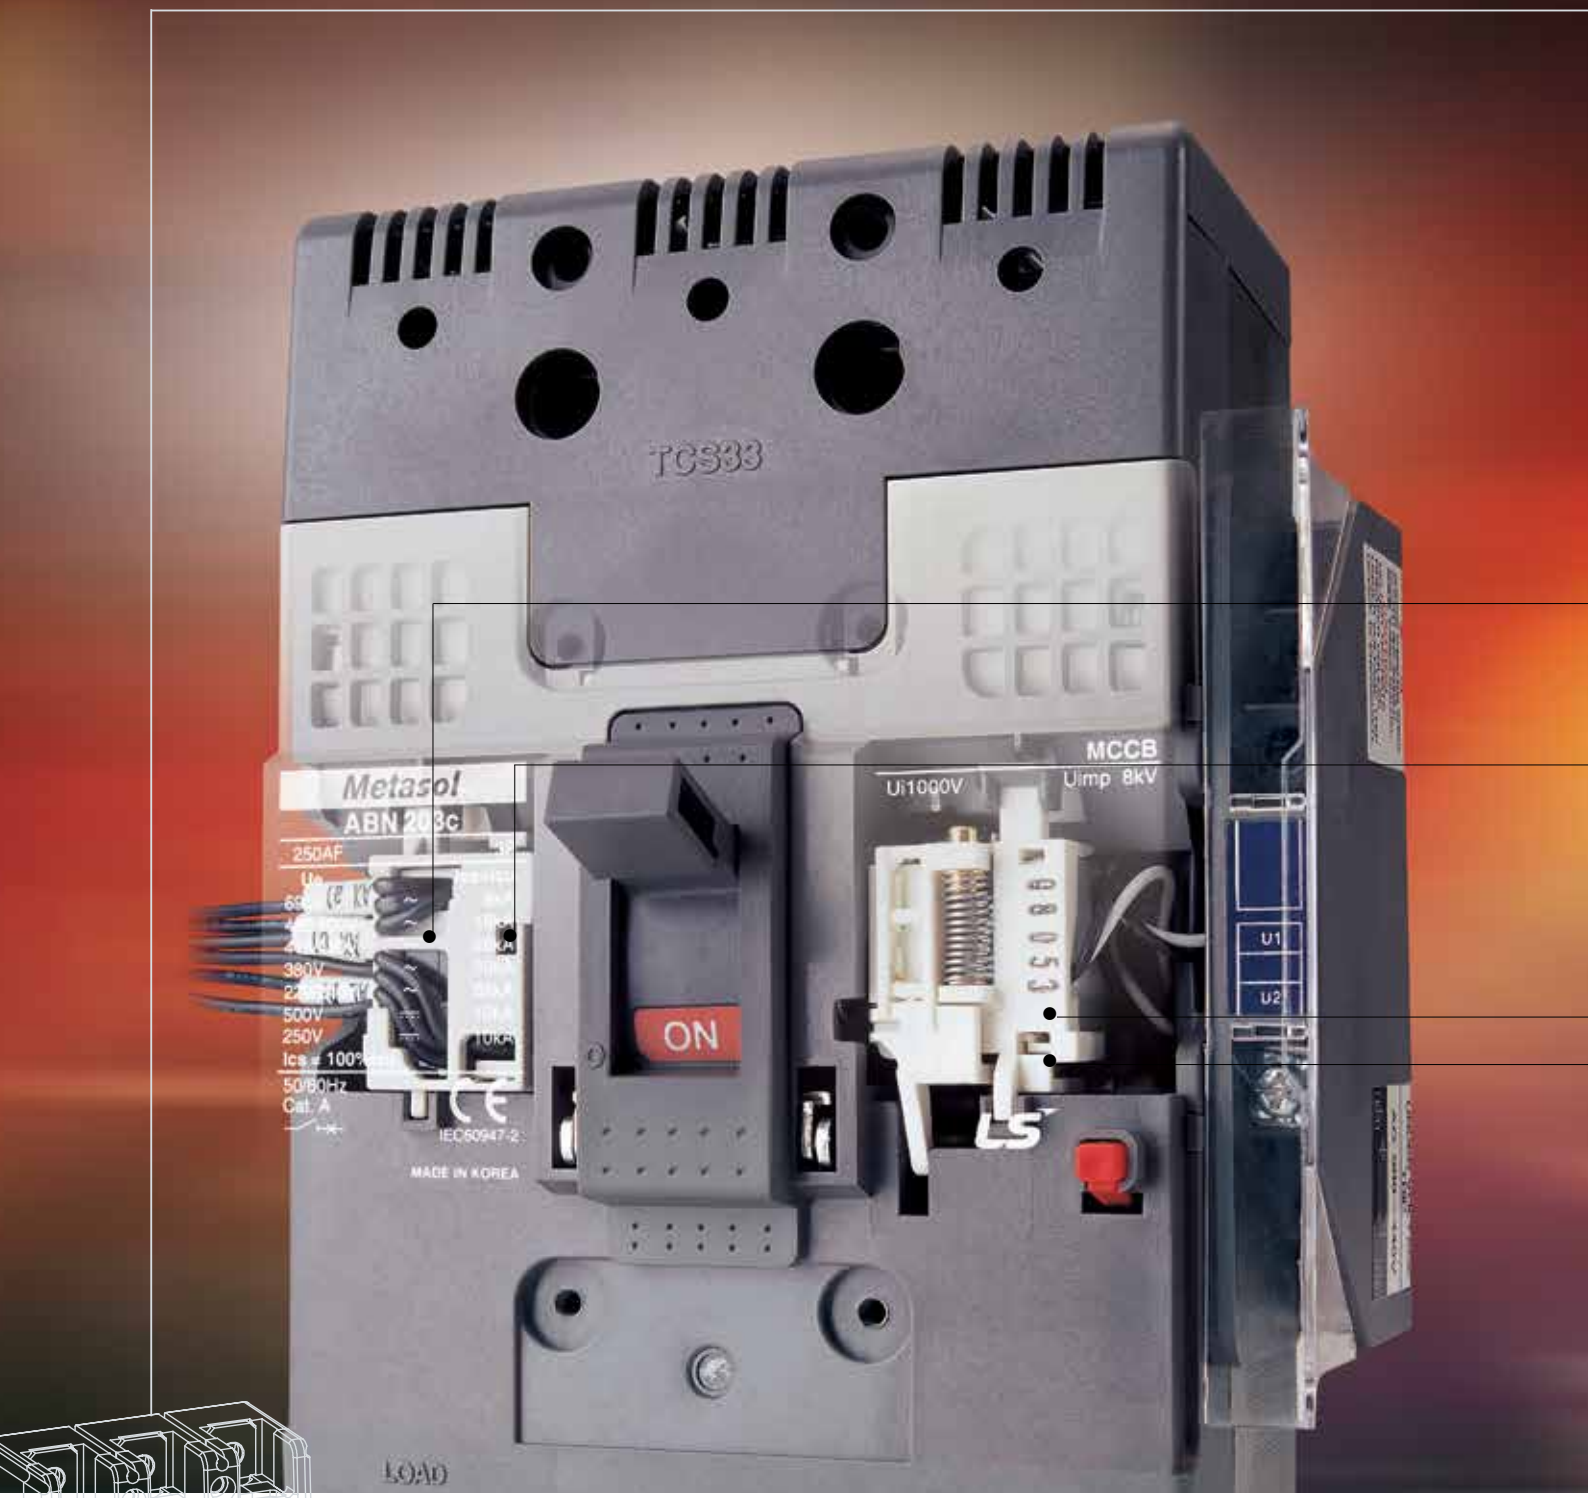
Various installable accessories

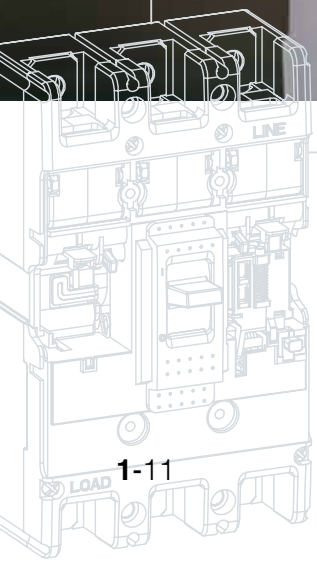
- Wider range of installable accessories compared to Meta MEC series.
- Composed of user friendly method.

System overview



1 Breaker
2 Internal auxiliaries
3 Plug-in kit (ELCB only)
4 Rotary handle (Direct)
5 Rotary handle (Direct, key lock)
6 Rotary handle Extended)
7 Rear terminal
8 Terminal cover (Short, long)
9 Insulation barrier
10 Handle lock
11 Remote operation





Internal accessories

Internal accessories can be commonly used in all Metasol MCCB and ELCB (Notice: Exception of SHT, UVT in ELCB)

Common use to all Metasol MCCBs and ELCBs

Alarm switch (AL)

Alarm switches offer provisions for immediate audio or visual indication of a tripped breaker due to overload, short-circuit, operation of shunt trip, or undervoltage trip conditions, operation of push button.

They are particularly useful in automated plants where operators must be signaled about changes in the electrical distribution system. This switch features a closed contact when the circuit breaker is tripped automatically. In other words, this switch does not function when the breaker is operated manually. Its contact is open when the circuit breaker is reset.

Auxiliary switch (AX)

Auxiliary switch is for applications requiring remote "On" and "Off" indication. Each switch contains two contacts having a common connection. One is open and the other closed when the circuit breaker is open, and vice-versa.

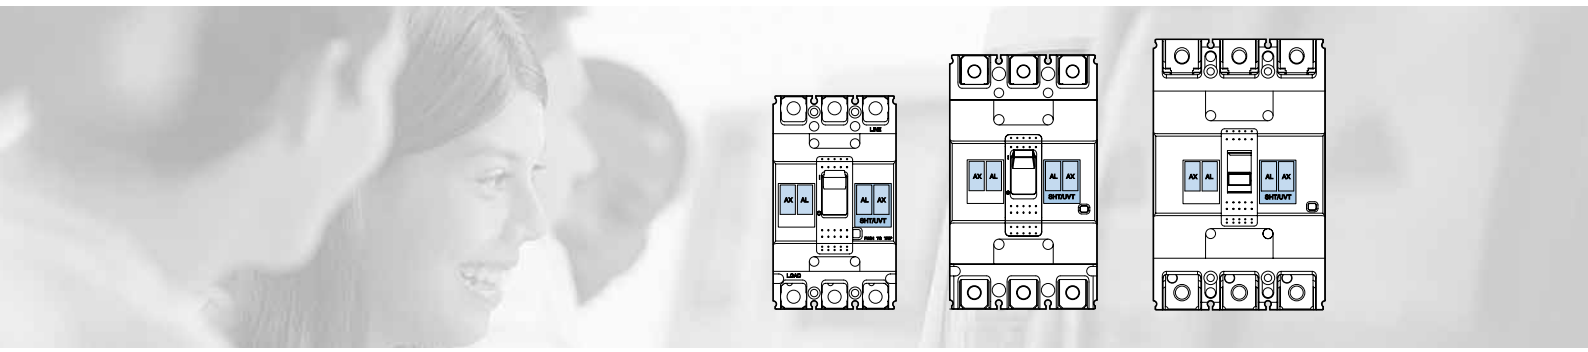
Undervoltage trip (UVT)

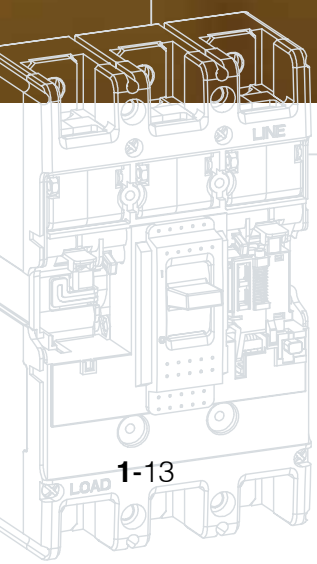
The undervoltage trip automatically opens a circuit breaker when voltage drops to a value ranging between 35% to 70% of the line voltage. The operation is instantaneous, and the circuit breaker cannot be reclosed until the voltage returns to 85% of line voltage.

Continuously energized, the undervoltage trip must be operating be fore the circuit breaker can be closed.

Shunt trip (SHT)

The shunt trip opens the mechanism in response to an externally applied voltage signal. LS shunt trips include coil clearing contacts that automatically clear the signal circuit when the mechanism has tripped.contact with live parts and thereby guarantee protection against direct contacts.

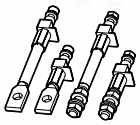




External accessories

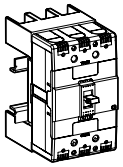
Designed for various mount and user safety.

External accessories



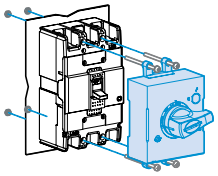
Front and rear connection

Several kinds of terminals can be equipped with ELCBs as well as MCCBs.
- Terminals for front connection
- Rear connection terminals



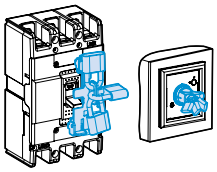
Plug-in base

It makes to extract and/or rapidly replace the circuit breaker without having to touch connections. (Easy replacement and maintenance)



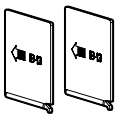
Direct & extended rotary handle

There are two types of rotary handles.
- Direct rotary handle (with or w/o key lock device)
- Extended rotary handle



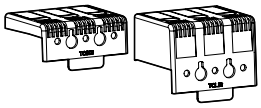
Locking device

- Fixed padlock
- Removable padlock
- Key lock device on direct handle



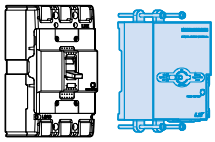
Insulation barrier

These allow the insulation characteristics between the phases at the connections to be increased.



Insulation terminal cover

The terminal covers are applied to the circuit-breaker to prevent accidental contact with live parts and thereby guarantee protection against direct contacts.



Remote operation

It is a device that makes it possible to turn On / Off the breaker even in the remote place. It is safe because it does not have to operate the handle of the circuit breaker by hand, and it is suitable for automation.

Marking and configuration

MCCB

MCCB model
- ABN: Economic type
- ABS: Standard type
- ABH: High capacity type

Standardized characteristics
Ui: Rated insulation voltage
Uimp: Impulse withstand voltage
Ue: Rated operational voltage
Icu: Ultimate breaking capacity
Ics: Service breaking capacity

Rated frequency

ELCB

Upstream connections
Fixing hole
Brand name
Indication of closed (On) position
Indication of open (Off) position
Product name
Trip indication by earth fault
Operating handle
Residual current (I△n) setting
Non-operating current setting
"Push to trip" button for earth fault
"Push to trip" button for overcurrent trip
Company logo
Certification mark
Fixing hole
Downstream connections

External configuration

MCCB

① Handle

- Function of indications

- "On" "Off" "Trip"

- Resetting

When the handle indicates "Tripped" position it must first be reset by moving the handle to the "Off" position and then closing is possible

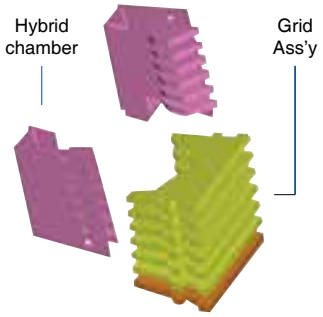
- Trip-free even if the handle is held at "On", the Breaker will trip if an over current flows
- Suitable for verification of the main contact position under abnormal conditions because the handle doesn't indicate open position

② Arc-Extinguishing unit

LS patent technique PASQ Arc-extinguishing unit

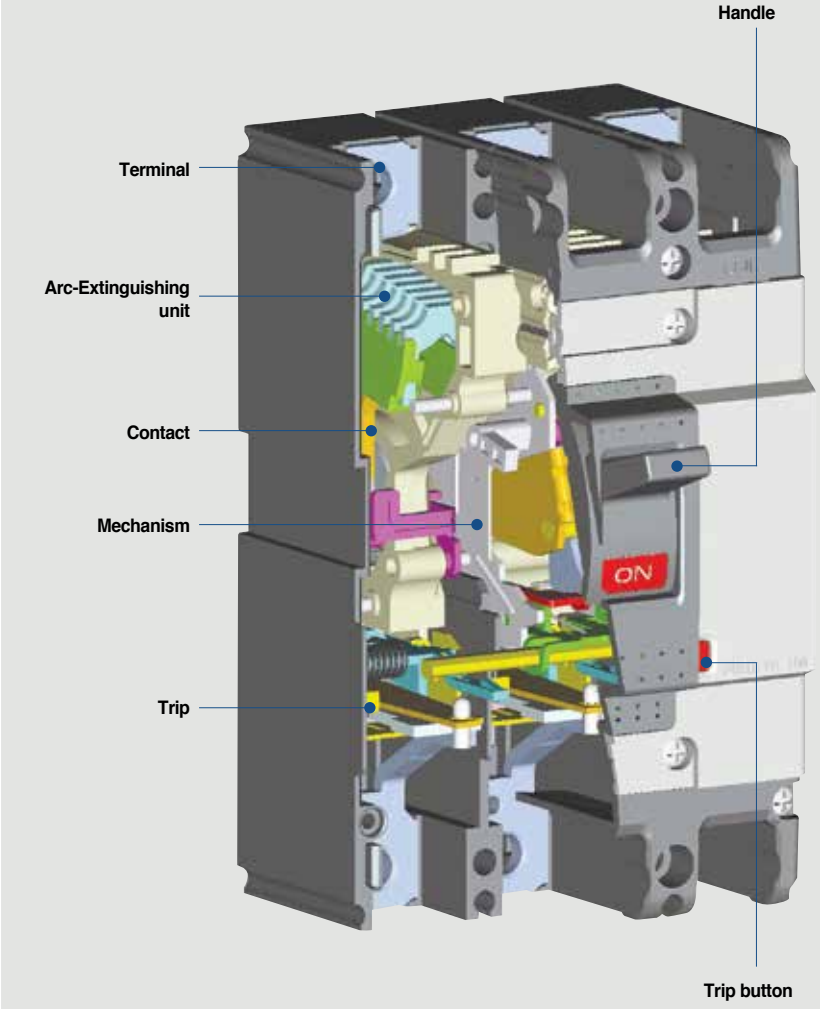
PASQ : Puffer assisted self-quenching

- Reduction of arc voltage for a short time

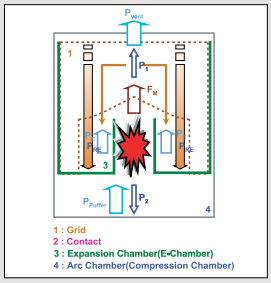


③ Trip button (Push to trip)

- Enables tripping mechanically from outside, for confirming the operation of the accessory switches and the manual resetting function.



A application of PASQ arc extinguishing

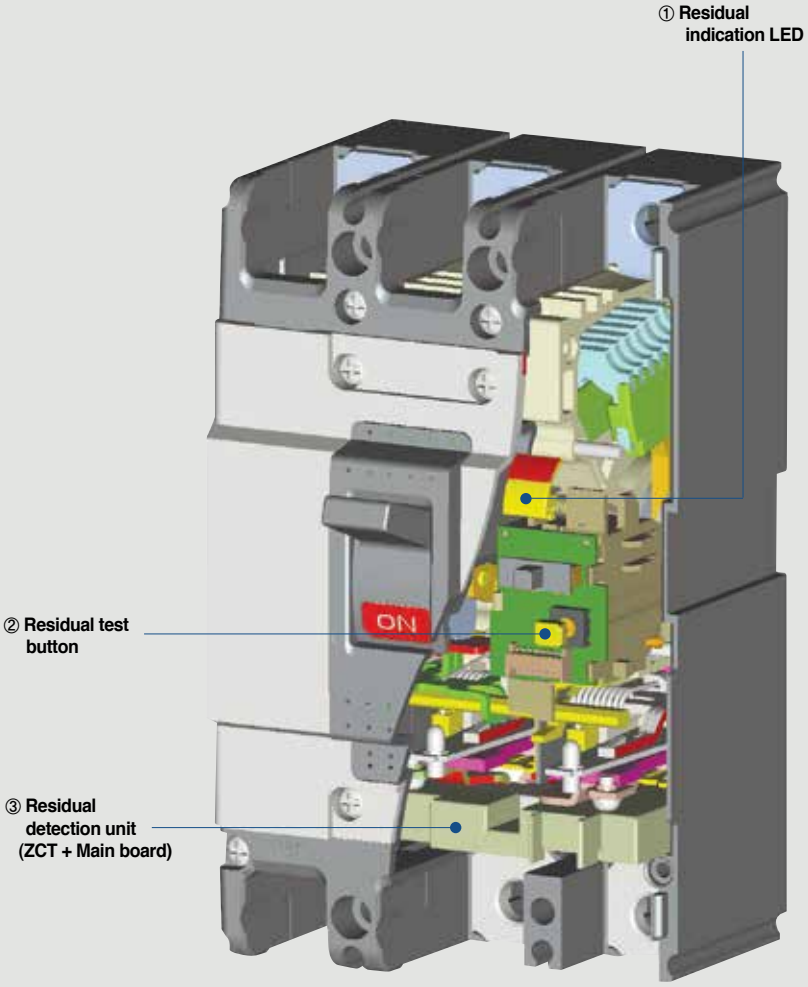


- The reduction of breaking time by applying PASQ arc extinguishing for inhibition of arc voltage for a short time.

A application of current limiting structure

- Current limiting repulsion structure (U fixed structure)
- Toggle structure
  - When the operating unit repulses by short circuit current, repulsion structure at bigger angle.

ELCB



① Residual indication LED

- Normal situation is yellow, trio situation is red

② Residual test button

- Special design for upgrade to prohibit resistance accident

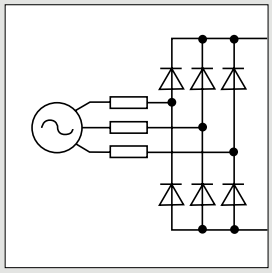
③ Residual detection unit (ZCT + Main board)

- For upgrade the design is selected the 3 phase input power method and in case of voltage problem, it can break residual current safely.

Upgrade coil operation by special design

- Sliding structure application of trip lever
- Trip special design by applying design button method.
- Upgrade the testing unit

3 phase power supply method



- In case of 1 phase loss residual operation upgrade
- New IEC standard

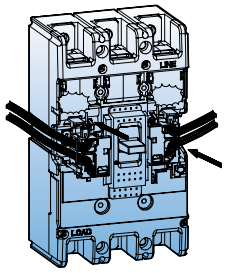
Auxiliary and alarm switch

Auxiliary switch (AX)

Auxiliary switch is for applications requiring remote "On" and "Off" indication.
Each switch contains two contacts having a common connection.
One is open and the other closed when the circuit breaker is open, and viceversa.

Alarm switch (AL)

Alarm switches offer provisions for immediate audio or visual indication of a tripped breaker due to overload, short circuit, shunt trip, or undervoltage release conditions.
They are particularly useful in automated plants where operators must be signaled about changes in the electrical distribution system. This switch features a closed contact when the circuit breaker is tripped automatically. In other words, this switch does not function when the breaker is operated manually.
Its contact is open when the circuit breaker is reset.



Combination switch (AX+AL)

It consists of one auxiliary switch (AX) and one alarm switch (AL) in a body to connect into the same position of the breaker.

Contact (AX+AL)

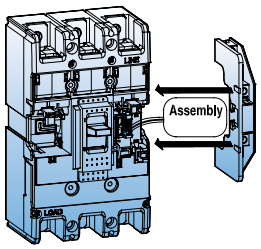
		250V	0.2	0.2		

Accessories

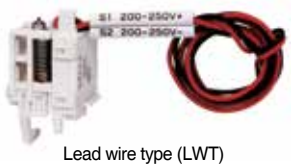
Shunt trip, SHT



The shunt trip opens the mechanism in response to an externally applied voltage signal. The releases include coil clearing contacts that automatically clear the signal circuit when the breaker has tripped. This is not available for ELCBs of 30~250AF .

Rating for 30~250AF

Terminal block type (TBT)



Lead wire type (LWT)

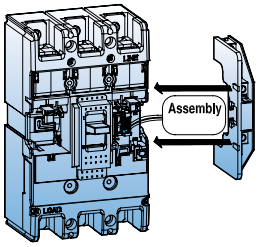
AC 440	4.3	1.9
AC 480	4.4	3.3
AC 550	4.6	2.4

Undervoltage release, UVT



The undervoltage release automatically opens a circuit breaker when voltage drops to a value ranging between 20% to 70% of the line voltage. The operation is instantaneous, and after tripping, the circuit breaker cannot be re-closed again until the voltage returns to 85% of line voltage.
Continuously energized, the undervoltage release must be operating before the circuit breaker can be closed.
This is not available for ELCBs of 30~250AF .

- Range of tripping voltage: 0.2 ~ 0.7Vn
- Reset and closing of a breaker is possible when the control voltage is over 0.85Vn
- Frequency (Only AC: 45Hz ~ 65Hz

Rating for 30~250AF

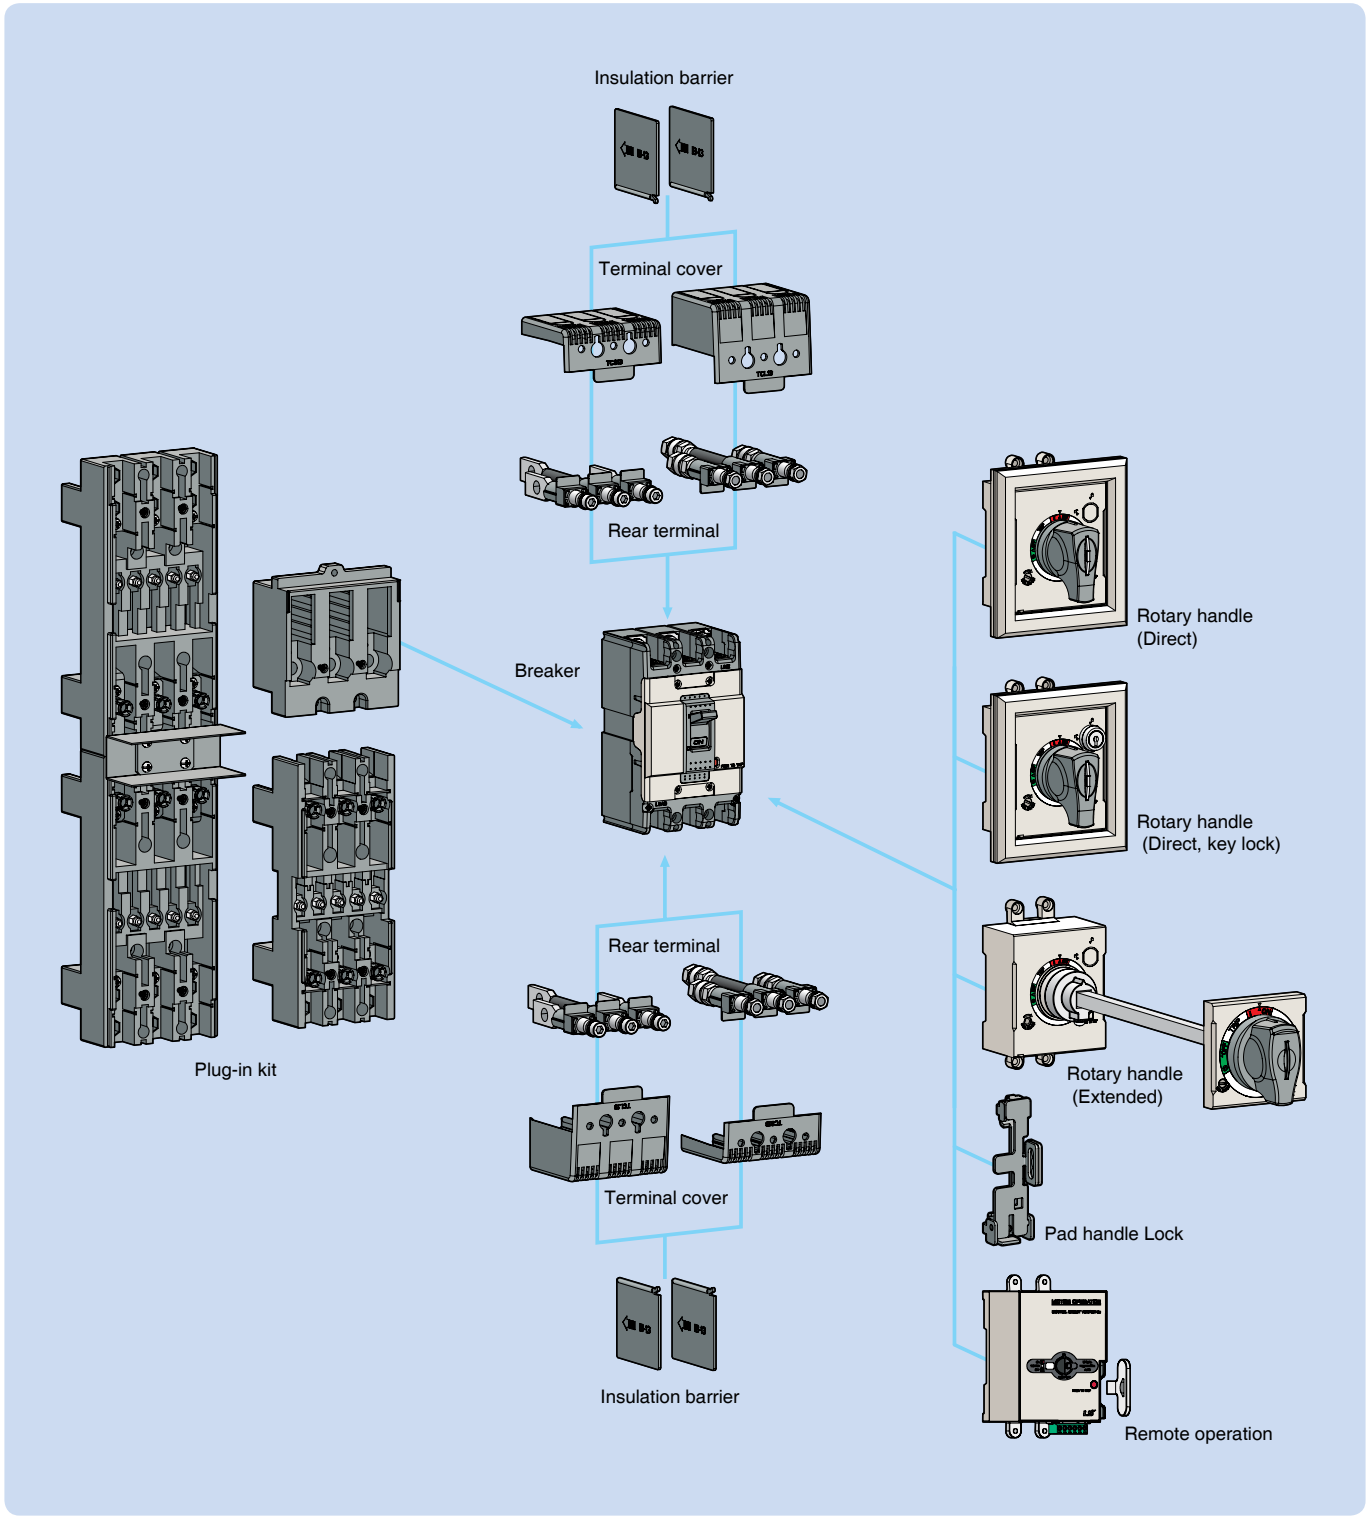
External accessories

Wide range of external accessories provides user-friendly solution for mounting, cable connection, insulation, safety lock and remote control.



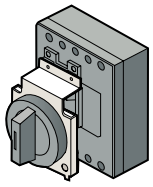
Rotary handles

Direct type

Direct type
(DH 30~250AF)

Key lock
(DH 30~250AF)

(N 30~250AF)



(N 400~800AF)

The rotary handle operating mechanism is available in either the direct version or in the extended version on the compartment door. It is always fitted with a compartment door lock and on a request it can be supplied with a key lock in the open position.

Direct type , D-handle and N-handle

- D-handle: Directly mountable to a circuit breaker. Trip button is built as standard. Key lock type is optional.
- N-handle: Directly mountable to a circuit breaker. Door is locked in the Off state. handle size is greater than D-handle.

Extended type, E-handle

It is used in case direct type handle can not be applied because of the longer distance between the breaker and the panel door.

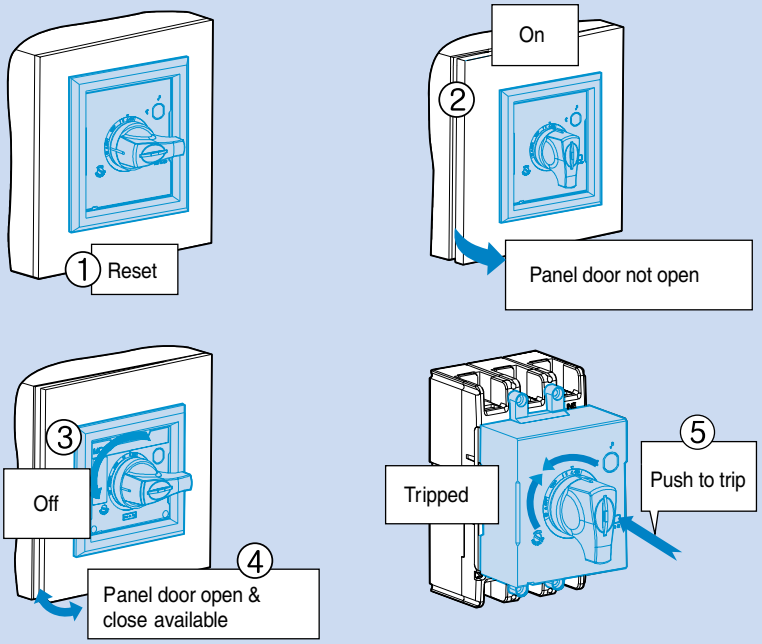
If the door is opened with much pressure when the position of handle is On or trip, the handle lock lever will be demaged.

Trip position: Panel door can't be opened



Locking system

Note : In case of EH100/125/250 Semi Type, it is possible to lock E-handle only in the condition of OFF.

Accessories

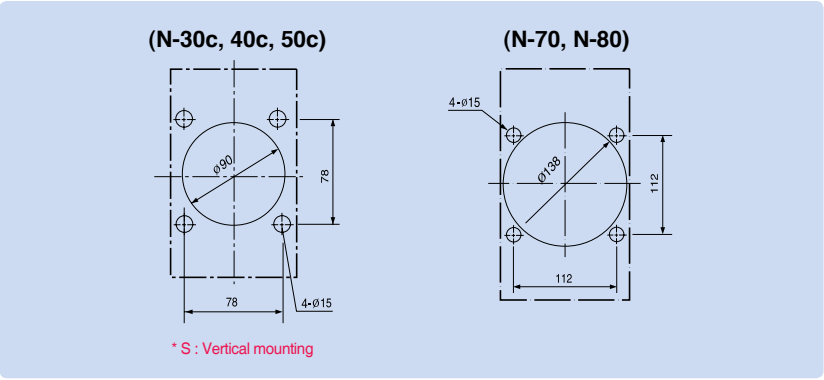
N-handle

How to mount

1) Drilling on the panel door

① All the N handles require the same size of mounting hole.

② Drill the holes according to the Fig. 1

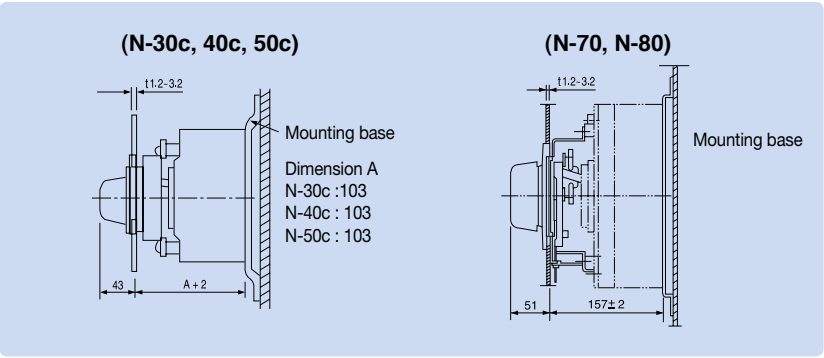


<Fig 1>

(2) Mounting base

① Prepare a mounting base according to the Fig. 2. The distance between the door panel and the mounting base should be A+2. Dimension A is shown in the Fig.

② In the case of horizontal mounting turn the breaker mounting holes by 90 degrees

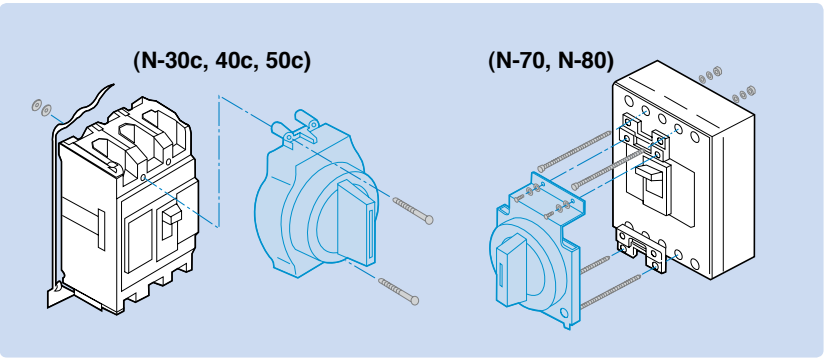


<Fig 2>

(3) Fixing

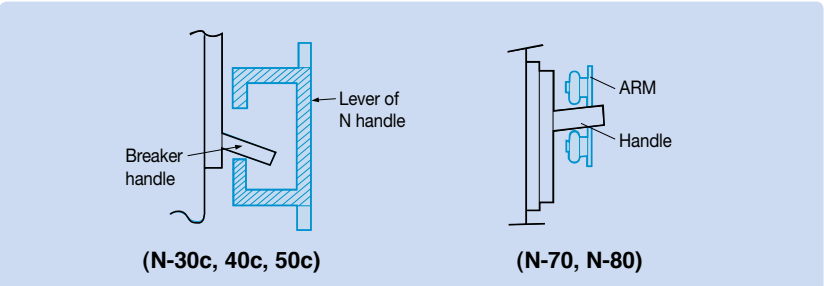
① Fixing a breaker and a handle at the same time.

a) As shown in the Fig. 3 a breaker and a handle can be fixed at the same time on a mounting base with the 4 (long) screws enclosed.



<Fig 3>

b) Have the breaker handle and the lever of N handle be located in the position shown in Fig. 4.



<Fig 4>

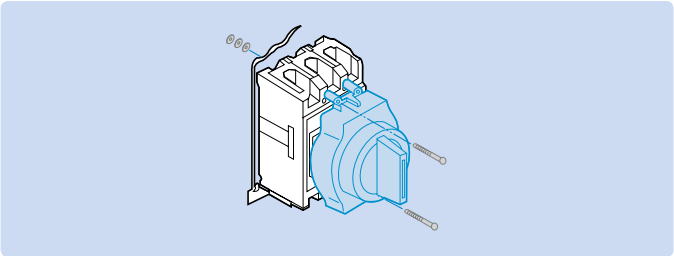
② Fixing a handle and a breaker step by step

a) Check if there is any thin membrane in the mounting hole of the breaker cover and remove it, If exists.

b) Have the breaker handle and the lever of N handle be located in the position shown in Fig. 4.

c) Fix the N handle on the breaker with the 2 (Short) screws enclosed.

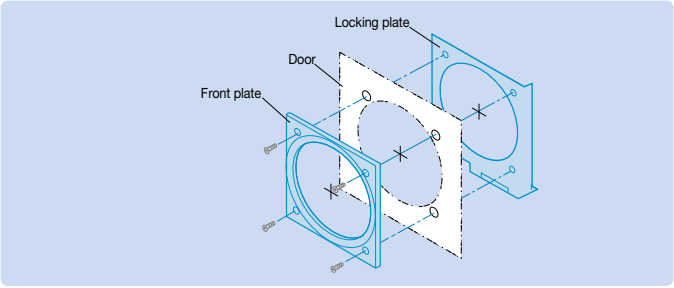
d) Fix the breaker on a mounting base with the 2 (Long) screws



<Fig 5>

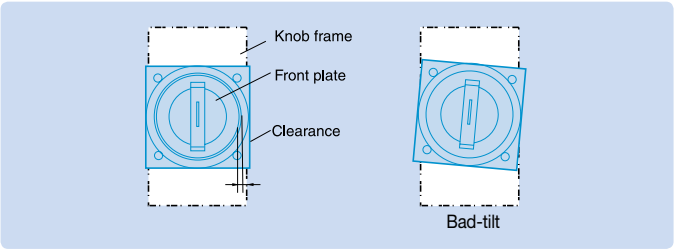
(4) Fixing front plate and lock plate

① Set the front plate and the locking plate on the door as shown in Fig. 6 fix them with screws.



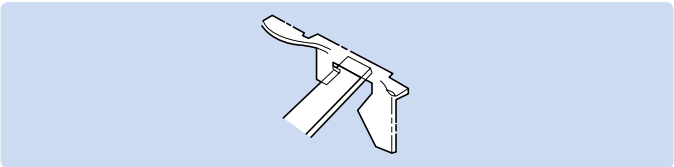
<Fig 6>

② Adjust if front plate or handle is at tilt against the breaker .



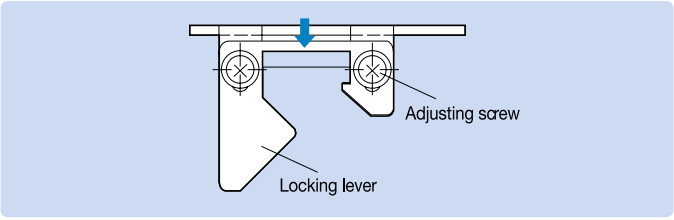
<Fig 7>

③ Verify that locking plate and locking lever interact on each other properly when the panel door is closed.
If necessary adjust them by following instructions.



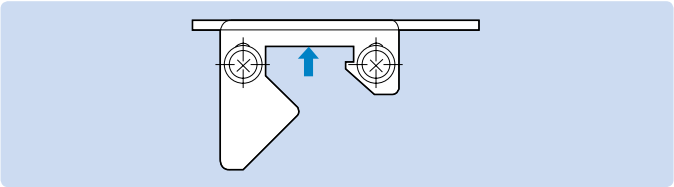
<Fig 8>

a) In the event the panel door is not fully closed
This happens if the distance between the door panel and the mounting base the panels of the door is short.
Loosen the adjusting screw in the lock plate and move the platein the direction of the arrow as shown in Fig. 9.



<Fig 9>

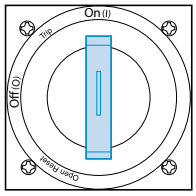
b) In the event the door does not lock after closing the door
This happens if the distance between the door panel and the mounting base the panels of the door is long.
Loosen the adjusting screw in the lock plate and move the plate in the direction of the arrow as shown in Fig. 10.



<Fig 10>

Accessories

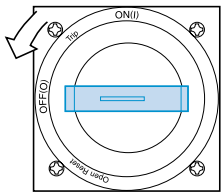
N-handle



<Fig 11>

(1) Operation in the door closed

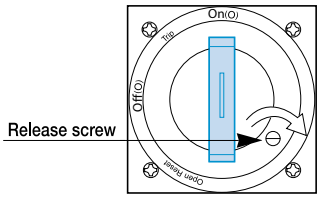
① To have the breaker On turn the handle to be vertical. <Fig. 11>
② To have the breaker Off turn the handle to be horizontal. <Fig. 12>
③ If the breaker is tripped, the handle points to the Trip position.
④ To reset the breaker turn the handle to Reset position.



<Fig 12>

(2) Unlocking the panel door

① The door is locked and will not open at On, Off and Trip status.
② To unlock the door from Off or Trip status turn the handle toward OPEN direction. (Unlocked after taking the hand off the handle.)
③ To unlock the door from on state turn the Release screw clockwise <Fig. 13>



<Fig 13>

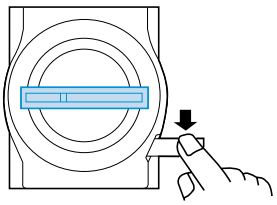
(3) Operation of the breaker in the door open

① When the door is open the breaker will not be on as the lock lever operates.
② To release the locking pull the lock lever to be nearly horizontal position. Then the breaker can be closed. <Fig. 14>
③ If the door is closed the lock lever will be reset automatically.

Padlocking

① Lockable at On or Off state with a padlock. (Padlock is not supplied)
- Lockable at Off state with a padlock is an optional spec.
② Pull the lock plate on the front of the handle and fasten the lock. <Fig. 15>
③ If the breaker is tripped after padlocking at on state, the handle will point to the trip.
④ Padlock diameter should be 3.5 ~ 6mm

(N-30, 40, 50)



(N-70, N-80)

Accessories

Terminal covers

The terminal covers are applied to the circuit-breaker to prevent accidental contact with live parts and thereby guarantee protection against direct contacts.
Two types by length are available and provide IP20 degree of protection.
Also, covers ara classified in to 2 different type: Independent, Attachable and detachable with D or N handle

- **Short type covers, TCS:**
  For fixed circuit-breakers with rear terminals and for moving parts of plug-in.
- **Long type covers, TCL:**
  For fixed circuit-breakers with front, front extended, front for cables terminals.

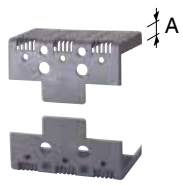
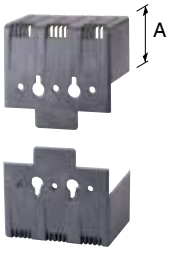
Note: Terminal covers for 400AF and 800AF MCCBs are in acrylic.



TCS (Short type)



TCL (Long type)

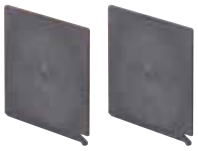
TCS/T (Short type)

TCL/T (Long type)

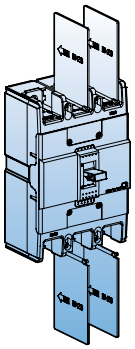
Short type construction

Long type construction

Insulation barriers



Insulation barrier allows the insulation characteristics between the phases at the connections to be increased.
They are mounted from the front, even with the circuit-breaker already installed, inserting them into the corresponding slots.
They are incompatible with both the insulating terminal covers.
It is possible to mount the phase separating partitions between two circuit-breakers side by side.



Type	Breaker	
	MCCB	ELCB
IB-13	ABN50c/60c/100c/100e ABS30c/50c/60c	EBN50c/60c/100c EBS30c/50c/60c
IB-23	ABS125c ABH50c/125c ABN250c, ABS250c ABH250c ABL125c, ABL250c	EBS125c EBH50c/125c EBN250c, EBS250c EBH250c
B-43B	ABN/S/H/L400c	EBN/S/H/L400c
B-33C	ABN/S/L800c	EBN/S/L800c

Insulation barriers for line side are provided as standard.

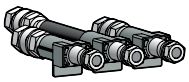
Accessories

Rear connection terminals

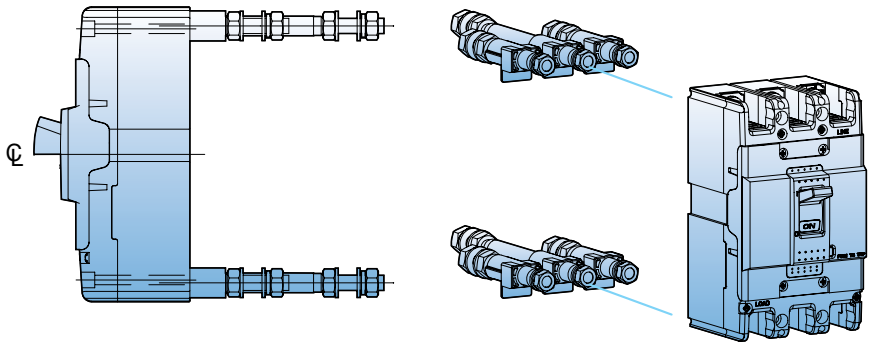
Rear connection terminals are used to adapt the circuit breakers to switchboards or other applications that require rear connection.
There are two kinds of rear connection terminals.

- Flat type
- Round type

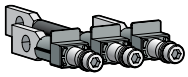
Round type terminals



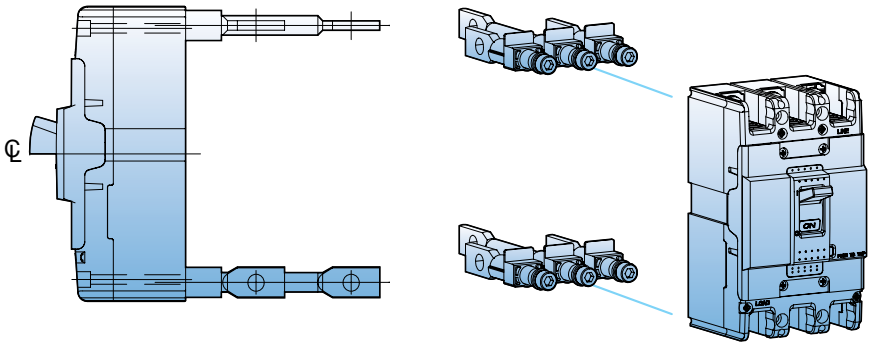
Breaker	For 2-pole	For 3-pole	For 4-pole
ABN100c 50AF	RTR1-52	RTR1-53	-
ABN100c 100AF	RTR1-102	RTR1-103	RTR1-104
ABH125c	RTR2-102	RTR2-103	RTR2-104
ABH250c	RTR3-202	RTR3-203	RTR3-204



Flat type terminals



Breaker	For 2-pole	For 3-pole	For 4-pole
ABN100c	RTB1-102	RTB1-103	RTB1-104
ABH125c	RTB2-102	RTB2-103	RTB2-104
ABH250c	RTB3-202	RTB3-203	RTB3-204



Mechanical interlock

The mechanical interlock is installed on the front of two breakers mounted side by side, in either the 3-pole or 4-pole version and prevents simultaneous closing of the two breakers. So it is suitable for consisting of manual sourcechangeover system.

Type numbering system

MI — **4** **3**

Type

Accessories

Plug-in base

Plug-in devices

Plug-in device makes it possible to extract and/or rapidly replace the circuit breaker without having to touch connections for ship and important installations.
The plug-in base is the fixed part of the plug-in version of the circuit-breaker.
It will be installed directly on the back plate of panel.
The circuit-breaker is racked out by unscrewing the top and bottom fixing screws.

Normal type plug-in MCCB
- MCCB current rating upto 250A
- Generally used in switchgears

Double-row type plug-in MCCB
- For 125AF MCCB
- Generally used in branch circuits

Plug-in type MCCB
(Plug-in terminal built)

Type names of blocks

Breaker	Arrangement	Plug-in block	Remark

Remote operation

Motor operator

Motor operators can also be operated by manual. The motor drives a mechanism which switches Metasol toggle handle to the "On" and “Off/Reset” positions.
- The manual actuator handle is located on the front of the cover.
- Manual or Automatic operation can be selected.
- Applicable to 2, 3 and 4-pole breakers.

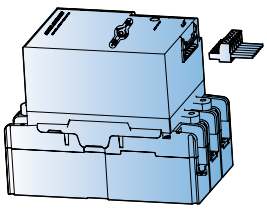
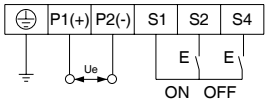
Wiring connection



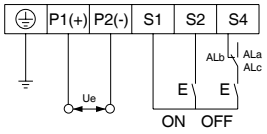
Standard connection

1) Remote On and Off of MCCB and manual operation
2) Be careful not to change the polarity at DC24V



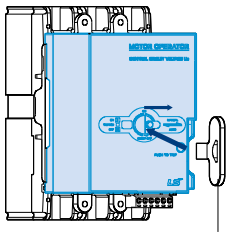
Connection with alarm switch (AL)

1) The connection diagram is the method of using a alarm switch (AL) without shunt or undervoltage trip.
   A trip due to a fault or trip button prevent a remote reset.
2) The fault must be cleared surely and reset it with manual operation.



Accessories

Remote operation



Manual operation

1) Insert the manual handle into the slot of Motor operator surface and rotate it clockwise.
2) It must be rotated just 180° clockwise for safe operation of micro switch in the motor operator.
3) Return the manual handle after the manual operation
4) Turn the slide switch back to the position of Auto.

CAUTION: When the circuit breaker is tripped by trip button in the Off status,
it is impossible to operate motor operator automatically It must be reset by manual operation.

Automatic operation

1) Set the slide switch to Auto, then internal power is closed automatically.
2) Operating frequency should be less than these below regulated values.
   MOP-M1~M3, M7 (120 operations per hour) , MOP-M4 (60 operations per hour) ,
   MOP-M5, M6 (20 operations per hour)
3) Use the On/Off switch in the range of regulated values.
4) It may interfere near communication equipments because of internal switching power supply.
   It's recommended that a noise filter be installed to power supply.
5) Please do not input On/Off signals at the same time during the automatic operation.
6) If the circuit breaker has a UVT attached inside, charge a UVT on the rated voltage before performing
   Motor operator.

Motor operator

Feature

① On position indication (Red color)
② Trip position indication (White color)
③ Off position indication (Green color)
④ Button for push to trip
⑤ On/Off/Reset selection lever
⑥ Manual/Auto selection lever

Safety clearance

When installing a circuit breaker, safety clearances must be kept between the breaker and panels, bars and other protection devices installed nearby. These safety clearances are depend on the ultimate breaking capacity and are defined by tests carried out in accordance with standard IEC 60947-2.
When a short circuit interruption occur, high temperatures pressures are present in and above the arc chambers of the circuit-breaker. In order to allow the pressure to be distributed and to prevent fire and arcing or short-circuit currents, safety clearances are required.

Insulation resistance (IR) testing & withstand voltage testing (For ELCB)

Insulation resistance (IR) testing

Insulation resistance marked as △ in table1 is not destroyed when 500V is applied using insulation tester but when 1000V is applied. Conduct the testing when the indicator needle of insulation tester wavers greatly. Make sure ELCB is Off before testing.

Withstand voltage testing

When conducting IR testing and withstand voltage testing, Do Not apply voltage for those marked as X in Table1.

Table1. insulation resistance (IR) testing & withstand voltage testing

Application circuit breaker / Application circuit breaker		Insulation resistance (IR) testing		Withstand voltage testing	
handle status		On	Off	On	Off

R-S, S-T, R-T	Line	△	△	×	○
	Load	△	△	×	×
Line-load		–	○	–	○

Standards & approval

Metasol series circuit breakers and auxiliaries comply with the following international standard:

- IEC 60947-1
  Low-voltage switchgear and controlgear - Part 1: General rules

- IEC 60947-2
  Low-voltage switchgear and controlgear - Part 2: Circuit-breakers

The following certificates are available on a request.

- CE Declaration of conformity
- Certificate of conformance test (CB) - IEC 60947

CE conformity marking

The CE conformity marking shall indicate conformity to all the obligations imposed on the manufacturer, as regards his products, by virtue of the european community directives providing for the affixing of the CE marking.
When the CE marking is affixed on a product, it represents a declaration of the manufacturer or of his authorized representative that the product in question conforms to all the applicable provisions including the conformity assessment procedures.

Standard use environment

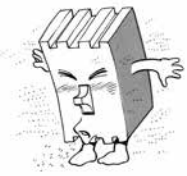
Standard use environment for molded case circuit breaker

The operation characteristic of Molded Case Circuit Breaker including short-circuit, overload, endurance and insulation is often influenced largely by external environment and thus should be applied appropriately with conditions of the place where it is used taken into consideration. In particular, the operation characteristic of the circuit breaker with a thermal magnetic trip element (FTU, FMU, ATU) applied changes a bit with the ambient temperature so you have to adjust the value of power rating accordingly when it is actually in use.

1) Ambient temperature: Within the range of -5℃~+40℃ (However, the average for the duration of 24 hours must not exceed 35℃.)
2) Relative humidity: Within the range of 45~85%
3) Altitude: 2,000m or less (However, if it exceeds 1,000m, atmosphere correction through humidity test and withstand voltage test can be considered.)
4) Atmosphere where excessive steam, oil steam, smoke, dust, salt, conductive powder and other corrosive materials do not exist

- If a standard circuit breaker is used in high temperature exceeding 40℃, you are advised to use it according to the current corrected for each level of ambient temperature in catalog.
- If used in conditions of highly humidity, the dielectric strength or electric performance may be degraded.

- There is no problem in conduction switch, trip or short circuit isolation in the temperature of -20℃.
- Passing or storage in stone-cold area is allowed in the temperature of 40℃.
- The operating characteristic of the breaker with a thermal magnetic trip element changes as the base ambient temperature is adjusted to 40℃.



- It is highly recommended to use a dust cover or anti-humid agent if it is used in dusty and humid conditions.
- Excessive vibration may cause a trip break such as connection fault or flaw on mechanical parts.

- If it is left On or Off for a long time, it is recommended to switch load current on a regular basis.
- It is recommend to put it in the sealed protection if corrosive gas is prevalent.

Special use environment

Environment where ambient temperature exceeds 40℃

The temperate of each module of a Molded Case Circuit Breaker is the sum of temperature increase by conduction and ambient temperature and if the ambient temperature exceeds 40℃ the passing current needs to be reduced so that the temperature of such element as internal insulator of MCCB exceed the maximum allowable temperature.

The base ambient temperature of Metasol breaker is set as 40℃ so if it has to be used in conditions with higher temperature than this, the rated current is required to be reduced a little as described in the table below.

Table of rated current for Metasol MCCB corrected according to ambient temperature

Environment where ambient temperature is -5℃ or less

Molded Case Circuit Breaker is subject to the effect of low temperature brittle of metal part inside and insulator, or changes in viscosity of lubricating oil in device, extra care should be taken not to have the temperature drop extremely with the use of such device as space heater. In addition, in case of using a thermal magnetic trip element (FTU, FMU, ATU) , the operating characteristic changes toward the difficult direction, so you should identify the relationship of protection and correct accordingly.
Although MCCB is not affected by conduction switch, trip, or short circuit isolation in the temperature of - 20℃, it is highly recommended to use a temperature maintaining device such as space heater. In addition, transportation and passing in stone-cold area in the temperature as low as -40℃ is allowed but it is recommend to leave the status of MCCB off or tripped in order to minimize the effect of brittle due to a low temperature.

High humidity condition (Relative humidity 85% or more)

Using Molded Case Circuit Breaker in a place of high humidity requires a rigorous maintenance including installation of anti-humidity agent within the structure in order to prevent the insulation sag of insulator or corrosion of mechanical parts as a result of high humidity. Also, in case of installing MCCB within the enclosed equipment, a space heater needs to be installed as well to prevent dew condensation that might occur due to a drastic temperature change.

Environment where petrochemical gas exists

The contact material of Molded Case Circuit Breaker is silver or silver alloy which develops creation of petrochemical coat that might cause a poor connection if it gets in contact with petrochemical gas.
However, it is easy for petrochemical coat to be mechanically taken off so it is no problem if make-and break operation occurs frequently but it needs to be switched back and forth between make and break if the operation rarely occurs.
The lead wire of moving contact of Molded Case Circuit Breaker can be disconnected as it is corroded or hardened by petrochemical gas. The silver coating is effective to prevent this from occurring and there is a need to increase durability of MCCB with the use of silver coated lead wire if it is used in environment with thick petrochemical gas.

Environment where potentially explosive gas exists

It is advised, in principle, not to install a Molded Case Circuit Breaker that switches and inhibits current in a dangerous place such as this one.

Impact of altitude

If an MCCB is used in an elevated area higher than 2000m sea level, its operating performance is subject to dramatic drop in atmospheric pressure and temperature. For example, the air pressure is reduced to 80% of ordinary pressure at 2,200m and further 50% at 5,500m although the short-circuit performance is not affected. If it is used in areas of high sea level, you can do correction based on the correction parameter table in high altitude environment, as described below

* Refer to the correction parameter table in high altitude environment (ANSI C37. 29-1970)
1) How to correct voltage:
- If the rated voltage is AC 600V at 4,000m above sea level, 600V (rated voltage) × 0.82 (correction parameter) = 492V.

2) How to correct current:
- If the rated voltage is AC 800A at above 4,000m sea level, 800A (rated current) × 0.96 (correction parameter) = 768A.

[Correction parameter table for altitude]

Altitude	Voltage correction parameter	Current correction parameter
2,000m	1.00	1.00
3,000m	0.91	0.98
4,000m	0.82	0.96
5,000m	0.73	0.94
6,000m	0.65	0.92

Environment with vibration and impulse exercised

Impact of vibration and impulse

An excessive vibration and impulse may cause damage on breaker or other security problems including dynamic strength. An appropriate consideration is required to select a right MCCB for an adverse environmental stress such as this one. Moreover, this stress may incur from vibration during transportation, magnetic impulse while manipulating a switch or may be affected by equipment in surrounding area.
There is a standard call [Vibration testing method for small electric appliances] for vibration and impulse test for electric equipment and the seismic and endurance tests of Molded Case Circuit Breaker are conducted in accordance with this standard, considering the circumstance mentioned above.

Vibration

The magnitude of vibration is measured by double amplitude and frequency with the following equation with accelerator.
αg = 0.002 × frequency (Hz) × double amplitude (mm)
* αg: Multiple of gravitational acceleration (g = 9.8m/sec2)
There are three types of vibration tests including resonance test, vibration endurance test, and malfunction test as described below.

1) Resonant test
Alter the frequency of sinusoidal wave within the range of 0~55Hz gradually with 0.5~1mm of double amplitude applied to see if there is any occurrence of vibration on a specific part of MCCB.

2) Vibration endurance test
A sinusoidal wave with double amplitude of 0.5~1mm and frequency of 55Hz (Resonant frequency obtained in previous clause if there is a resonant point) is manually created to check the operational status.

3) Malfunction test
Apply vibration for 10 minutes for each condition of altering double amplitude and frequency to check if there is any malfunction in MCCB.

Impulse

The magnitude of impulse is denoted by the multiple of gravitational acceleration imposed on the equipment and part. The test is conducted through a drop impulse test.

Impact of high frequency

In case of high frequency current, you are required to reduce the rated current of the breaker with a thermal magnetic trip element embedded due to heat incurred by the skin effect of conductor and/or core less of structure. The reduction rate varies according to the frame Size and rated current and decreases down to 70~80% at 400Hz. In addition, the core loss decreases attractive force, which leads to increase of instantaneous trip current.

* Core loss: It refers to the electrical loss in a transformer caused by magnetization of the core that changes over time and is categorized into hysteresis loss and eddy current loss.

* Hysteresis loss: It takes up the majority portion of no-load loss of electric equipment and is calculated like this.
$Ph = \sigma f Bmn$
Bm: Maximum value of magnetic flux density, n: constant (1.6~2.0) , f: Frequency, σ: Hysteresis constant

* Eddy current: It refers to an induced electric current formed within the body of a conductor when it moves through a non-uniform or changing magnetic field. The eddy current that incurs at winding of transformer or core is considered as one of the transformer losses as a part of exciting current. It is also called 'eddy current loss'.

Use environment with vibration and impulse applied

[Table of seismic performance and internal impulse performance]

		Test	Internal impulse
Test condition	**Mounting vibration, direction of impulse**	• Vertical mounting • Top-down, Left-right, Front-back 	• Picture 1, 2, 3, 4 (→ Represents the direction of drop) 	Status of MCCB	(1) Non-conduction (On or Off status) (2) Status where rated current is conducted until the temperature of MCCB becomes constant and keeps being conducted	Non-conduction (On or Off status)
Test result	**Judgment condition**	• If it is On, it should not be Off • If it is Off, it should not be On • No abnormal status such as damage, transformation, or annealing of nut part • Characteristics of switch and trip after the test must be normal

FUTURING SMART ENERGY

We open up a brighter future through
efficient and convenient energy solutions.

Safety Instructions

- For your safety, please read user's manual thoroughly before operating.
- Contact the nearest authorized service facility for examination, repair, or adjustment.
- Please contact qualified service technician when you need maintenance.
  Do not disassemble or repair by yourself!
- Any maintenance and inspection shall be performed by the personnel having expertise concerned.

- According to The WEEE Directive, please do not discard the device with your household waste.
